Test generation - predicate analysis

Consider the BOR, BRO, BRE criteria for testing predicates including expressions and relational operator, and shortly introduce their objectives and differences. Use the most appropriate criteria to generate a test set, able to discover logical and relational fault, for the following compound predicate. In case it is possible you can simplify the condition:

$$a \ge b \land \neg((a = b) \lor (c \ge b + 5)) \tag{1}$$

$$(x^2 \ge 0 \land x^2 y \ge 5z) \lor x^2 > y \tag{2}$$

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Our company is going to develop a communication system that has to abide by the following specification (protocol):

- Initially the system waits a message that can include an integer betwenn the value 0 and 100 and then it behaves accordingly to the following rules:
 - In case the received value is smaller or equal to 50 the system output message ack and then it moves at point 2
 - In case a value between 51 and 100 is received the system output message ack and it moves at point 3
- if the system receives message msg1 it outputs message error and it moves to point 4 while if it receives message msg2 it outputs message ack and it moves to point 3
- if the system receives message msg2 it outputs message error and it moves to point 5 while if it receives message msg1 it outputs message ack and it moves to point 2
- if the system receives message msg1 it outputs the message ack and it goes to 4. At receiving msg2 the system outputs message ack and it moves back to point 2.
- if the system receives message msg2 it outputs the message ack and it goes to 5. At receiving msg1 the system outputs message ack and it moves to 3.

Select the test derivation stategy that you consider best suited for testing the system to be implemented.

Our company is going to develop a system that has to run according to the following possible configuration parameters:

- Operating System: Linux, Windows
- Browser: Chrome, Edge
- DBMS: MySQL, PostgreSQL
- ▶ Web Server: IIS, Apache
- Business Logic Container: ISAPI, Tomcat

Derive a test set according using the most suitable approach among the ones presented in the course. In the generation consider that there are some constraints that have to be respected:

- It is not possible to generate a configuration of a system using the OS Linux and the Web Server IIS
- The container ISAPI can be used only with the web server IIS and equally the Tomcat container can be used only with the Apache Web Server
- The Apache, Postgres combination is not available on a Windows machine for which the connector is not available

э

Example

Consider a program conceived to satisfy the following requirements:

- *R*₁: Given coordinate position x, y, and z, and a direction value *d*, the program must invoke one of the three functions fire-1, fire-2, and fire-3 as per conditions below:
 - *R*_{1,1}: Invoke fire-1 when (x<y) and (z*z>y) and (prev="East") where prev and current denote, respectively, the previous and current values of *d*.
 - $R_{1,2}$: Invoke fire-2 when (x<y) and (z*z \leq y) or (current="South")
 - **R**_{1,3}: Invoke fire-3 when none of the two conditions above is true
- \textit{R}_2 : The invocation described above must continue until an input Boolean variable becomes true
 - Select a generation strategy to "carefully" test the system

< 日 > < 同 > < 回 > < 回 > < □ > <

A possible Source Code

Consider the following code and provide an evaluation for the Condition/decision coverage obtained by the defined test suite:

```
begin
float x,y,z; direction d; string prev, current; bool done;
input (done); current ='North';
while(!done) {
  input(d); prev=current;current=f(d); input(x,y,z);
  if ((x < y) \text{ and } (z + z > y) \text{ and } (prev == 'East'))
    fire-1(x, y);
  else
     if ((x < y) and (z * z <= y) or (current == 'South'))
        fire - 2(x, y);
     else {
        fire-3(x, y);
       input(done); }
output('Firing completed');
end
```

Improve the Test suite

... continue

Given the code shown in the previous slide try to derive a test suite satisfying the MC/DC coverage criterion

Miscellanea

- Given a set of requirements apply domain partitioning
- Combinatorial approaches
- Build a data flow graph
- Questions to be synthetically answered
- Combinations of different approaches
