$T : \text{Expr} \rightarrow \text{Post Expr}$

$$\begin{cases} T[m] = m & (\text{base case}) \\ T[e_1 \text{ op } e_2] = T[e_1] \cdot T[e_2] \cdot \text{'op'} \\ T[(e)] = T[e] \end{cases}$$

We use the same recursion to define an SDD that is S-attributed

We add to the grammar an attribute code of type String for the non-terminal symbols expr and term. The attribute is synthesized. The resulting S-attributed SDD is the following

$$\text{expr} \rightarrow \text{expr}_1 + \text{term} \quad \left\{ \begin{array}{l} \text{expr.code} = \text{expr}_1.\text{code} \parallel \text{term.code} \\ \parallel '+' \end{array} \right\}$$

$$\text{expr} \rightarrow \text{expr}_1 - \text{term} \quad \left\{ \text{expr.code} = \text{expr}_1.\text{code} \parallel \text{term.code} \parallel '-' \right\}$$

$$\text{expr} \rightarrow \text{term} \quad \left\{ \text{expr.code} = \text{term.code} \right\}$$

$$\text{term} \rightarrow 0 \quad \left\{ \text{term.code} = '0' \right\}$$

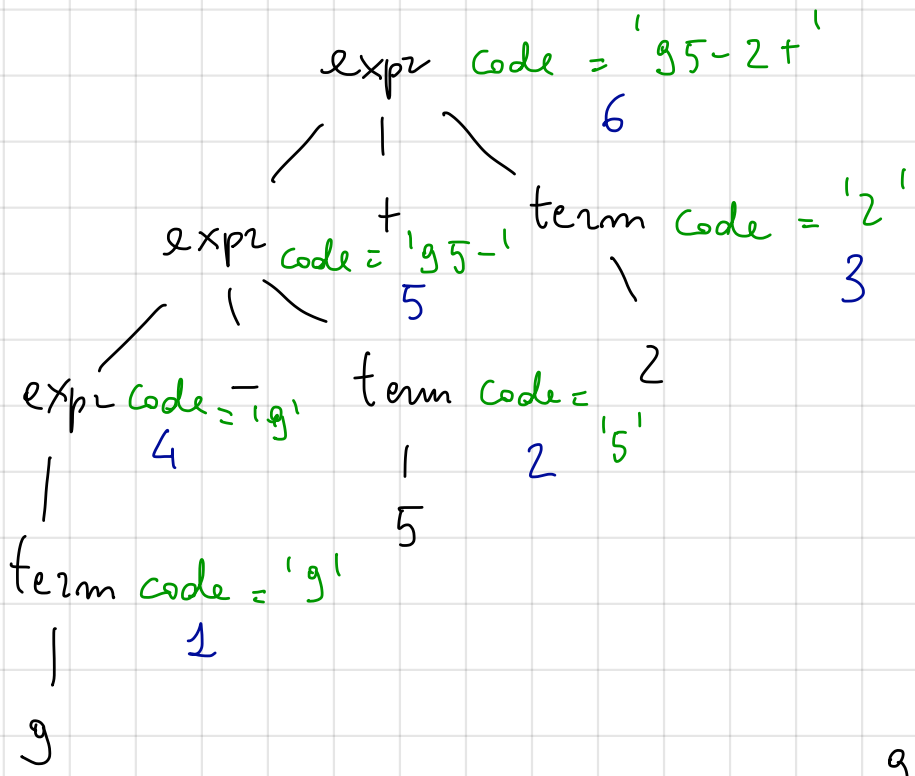

$$\text{term} \rightarrow 9 \quad \left\{ \text{term.code} = '9' \right\}$$

$$\text{term} \rightarrow (\text{expr}) \quad \left\{ \text{term.code} = \text{expr.code} \right\}$$
