Compilers A. Y. 2019/2020
Written Test of 19th February 2020 (Session/Appello II)
Teacher: Luca Tesei

NOTE: Regular expressions should be written using the usual rules of precedence: the $*$ operator has precedence on concatenation, which has precedence on the $|$ operator. The notation $(r)^+$ can be used with the usual meaning.

EXERCISE 1 (10 points)

Consider the following regular expression:

$$a^*(bc^* | (bc)^+)$$

1. Give a minimal automaton accepting the language denoted by the regular expression. Show all the steps leading to your solution.

SOLUTION

The solution is in the following page.

EX1 | $a^*(bc^* | (bc)^+)$

An NFA for the language is

Let's use the subset construction algorithm for obtaining an equivalent DFA

	a	b	c
$\{0\} = A$	$\{0\}$	$\{1\}$	$\{ \}$
$\{1\} = B$	$\{ \}$	$\{ \}$	$\{2, 3\}$
$\{2, 3\} = C$	$\{ \}$	$\{4\}$	$\{2\}$
$\{2\} = D$	$\{ \}$	$\{ \}$	$\{2\}$
$\{4\} = E$	$\{ \}$	$\{ \}$	$\{3\}$
$\{3\} = F$	$\{ \}$	$\{4\}$	$\{ \}$

The obtained DFA, completed with a dead state, is:

Let's try to minimise this DFA.

Partition 1 (A E dead) (BCDF)

$$\left. \begin{array}{l} A \xrightarrow{c} \text{dead} \\ E \xrightarrow{c} F \\ \text{dead} \xrightarrow{\quad} \text{dead} \end{array} \right\} \Rightarrow A \text{ can be differentiated}$$

Partition 2 (E) (A dead) (BCDF)

$$\left. \begin{array}{l} A \xrightarrow{b} B \\ \text{dead} \xrightarrow{b} \text{dead} \end{array} \right\} \Rightarrow A \text{ and dead are different}$$

Partition 3 (E) (A) (dead) (BCDF)

$$\left. \begin{array}{l} B \xrightarrow{c} C \\ C \xrightarrow{c} D \\ D \xrightarrow{c} D \\ F \xrightarrow{c} \text{dead} \end{array} \right\} \Rightarrow F \text{ can be differentiated}$$

Partition 4 (E) (A) (dead) (BCD) (F)

$B \xrightarrow{b} \text{dead}$
 $C \xrightarrow{b} E$
 $D \xrightarrow{b} \text{dead}$ } $\Rightarrow C$ can be differentiated

Partition 5 (E) (A) (dead) (BD) (C) (F)

$B \xrightarrow{c} C$
 $D \xrightarrow{c} D$ } B and D are different

Partition 6 (E) (A) (dead) (B) (D) (C) (F)

The DFA is minimal because no states can be considered equivalent.

EXERCISE 2 (12 points)

Consider the following grammar:

$$\begin{aligned} S &\rightarrow B \mid Caa \\ B &\rightarrow bC \\ C &\rightarrow bbCa \mid \epsilon \end{aligned}$$

1. Write formally the language generated by the grammar as a set of strings.
2. Is the grammar LR(1)? If so, give the table of a bottom-up shift-reduce parser and show the parsing of the string *bbba*.

SOLUTION

The language can be expressed as follows:

$$L(S) = \{b^{2n+1}a^n \mid n \geq 0\} \cup \{b^{2n}a^{n+2} \mid n \geq 0\}$$

Let us start checking if the grammar is SLR(1). If so, it is also LR(1). Let us compute the set of LR(0) items:

$I_0 = \begin{aligned} S' &\rightarrow \cdot S \\ S &\rightarrow \cdot B \\ S &\rightarrow \cdot Caa \\ B &\rightarrow \cdot bC \\ C &\rightarrow \cdot bbCa \\ C &\rightarrow \cdot \end{aligned}$	$I_1 = \text{goto}(I_0, S) = S' \rightarrow S \cdot$
$\begin{aligned} I_2 &= \text{goto}(I_0, B) = S \rightarrow B \cdot \\ I_3 &= \text{goto}(I_0, C) = S \rightarrow C \cdot aa \end{aligned}$	$I_4 = \text{goto}(I_0, b) = \begin{aligned} B &\rightarrow b \cdot C \\ C &\rightarrow b \cdot bCa \\ C &\rightarrow \cdot bbCa \\ C &\rightarrow \cdot \end{aligned}$
$\begin{aligned} I_5 &= \text{goto}(I_3, a) = S \rightarrow Ca \cdot a \\ I_6 &= \text{goto}(I_4, C) = B \rightarrow bC \cdot \end{aligned}$	$I_7 = \text{goto}(I_4, b) = \begin{aligned} C &\rightarrow bb \cdot Ca \\ C &\rightarrow b \cdot bCa \\ C &\rightarrow \cdot bbCa \\ C &\rightarrow \cdot \end{aligned}$
$\begin{aligned} I_8 &= \text{goto}(I_5, a) = S \rightarrow Caa \cdot \\ I_9 &= \text{goto}(I_7, C) = C \rightarrow bbC \cdot a \end{aligned}$	$\begin{aligned} \text{goto}(I_7, b) &= I_7 \\ I_{10} &= \text{goto}(I_9, a) = C \rightarrow bbCa \cdot \end{aligned}$

It holds that $\text{FOLLOW}(S') = \text{FOLLOW}(S) = \text{FOLLOW}(B) = \{\$\}$ and $\text{FOLLOW}(C) = \{a, \$\}$. There are no conflicts in the set of LR(0) items, meaning that the grammar is SLR(1) and LR(1). The parsing table for the corresponding bottom-up shift-reduce parser is as follows:

	<i>a</i>	<i>b</i>	$\$$	<i>S</i>	<i>B</i>	<i>C</i>
0	r5	s4	r5	1	2	3
1			acc			
2			r1			
3	s5					
4	r5	s7	r5			6
5	s8					
6			r3			
7	r5	s7	r5			9
8			r2			
9	s10					
10	r4		r4			

The parsing of the string *bbba* is in the following:

STACK	INPUT	ACTION
\$0	<i>bbba</i> \$	shift 4
\$0 <i>b</i> 4	<i>bba</i> \$	shift 7
\$0 <i>b</i> 4 <i>b</i> 7	<i>ba</i> \$	shift 7
\$0 <i>b</i> 4 <i>b</i> 7 <i>b</i> 7	<i>a</i> \$	reduce 5
\$0 <i>b</i> 4 <i>b</i> 7 <i>b</i> 7 <i>C</i> 9	<i>a</i> \$	shift 10
\$0 <i>b</i> 4 <i>b</i> 7 <i>b</i> 7 <i>C</i> 9 <i>a</i> 10	\$	reduce 4
\$0 <i>b</i> 4 <i>C</i> 6	\$	reduce 3
\$0 <i>B</i> 2	\$	reduce 1
\$0 <i>S</i> 1	\$	accept

EXERCISE 3 (12 points)

Consider a language of expressions defined recursively as follows:

- (i) x is an expression;
- (ii) if e_1, e_2, \dots, e_n (with $n > 0$) are expressions then $f(e_1, \dots, e_n)$ is an expression.

Your tasks are:

1. Define a Syntax Directed Translation Scheme suitable to be implemented by a top-down parser and such that it computes, for the starting symbol, an attribute \mathbf{m} of type `int`. For a give expression, \mathbf{m} must give the maximum number of arguments to which the function f is applied to. The maximum must be computed considering any possible subexpression, not only the top level f . Examples:
 - for the expression x it must result $\mathbf{m} = 0$,
 - for the expression $f(x)$ it must result $\mathbf{m} = 1$,
 - for the expression $f(f(x))$ it must result $\mathbf{m} = 1$,
 - for the expression $f(x, f(x, x))$ it must result $\mathbf{m} = 2$,
 - for the expression $f(f(x, x))$ it must result $\mathbf{m} = 2$,
 - for the expression $f(x, f(x, x), f(x, f(x)))$ it must result $\mathbf{m} = 3$,
 - for the expression $f(f(x, x), f(x, f(x), f(f(f(f(x))))))$ it must result $\mathbf{m} = 3$.

SOLUTION

The solution is in the following page.

Ex 3 | Let us give first an LL(1) grammar for the

Language: $\Sigma = \{x, f, (,), "\$"}\}$

$$E \rightarrow x \mid f(L)$$

$$\text{FIRST}(E) = \{x, f\} = \text{FIRST}(L)$$

$$L \rightarrow EA$$

$$\text{FIRST}(A) = \{", \epsilon\}$$

$$A \rightarrow , L \mid \epsilon$$

$$\text{FOLLOW}(E) = \{\$, ")", "\$"\}$$

The parsing table is \downarrow

$$\text{FOLLOW}(L) = \{")\}$$

$$\text{FOLLOW}(A) = \{")\}$$

	x	f	()	,	\$
E	$E \rightarrow x$	$E \rightarrow f(L)$				
L	$L \rightarrow EA$	$L \rightarrow EA$				
A				$A \rightarrow \epsilon$	$A \rightarrow , L$	

The table is not multiply defined, so the grammar is LL(1).

The SDT is as follow: (for attributes see next page)

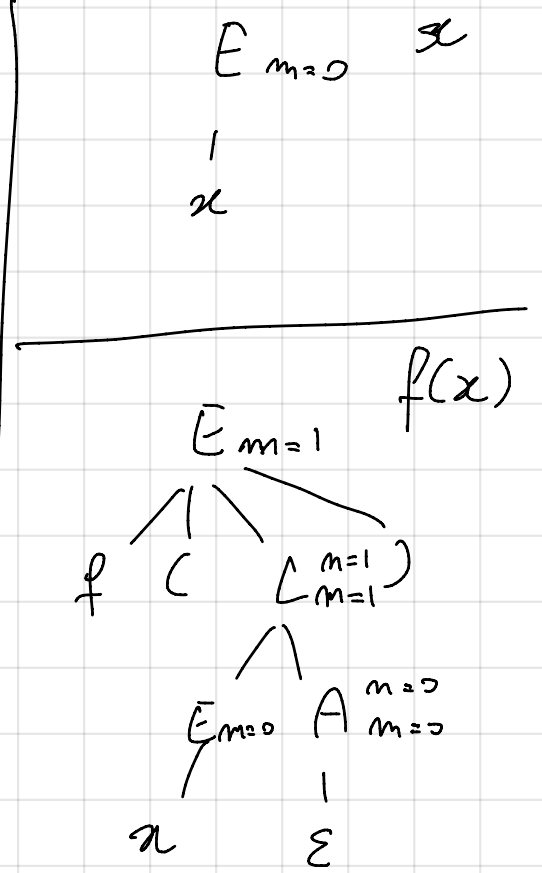

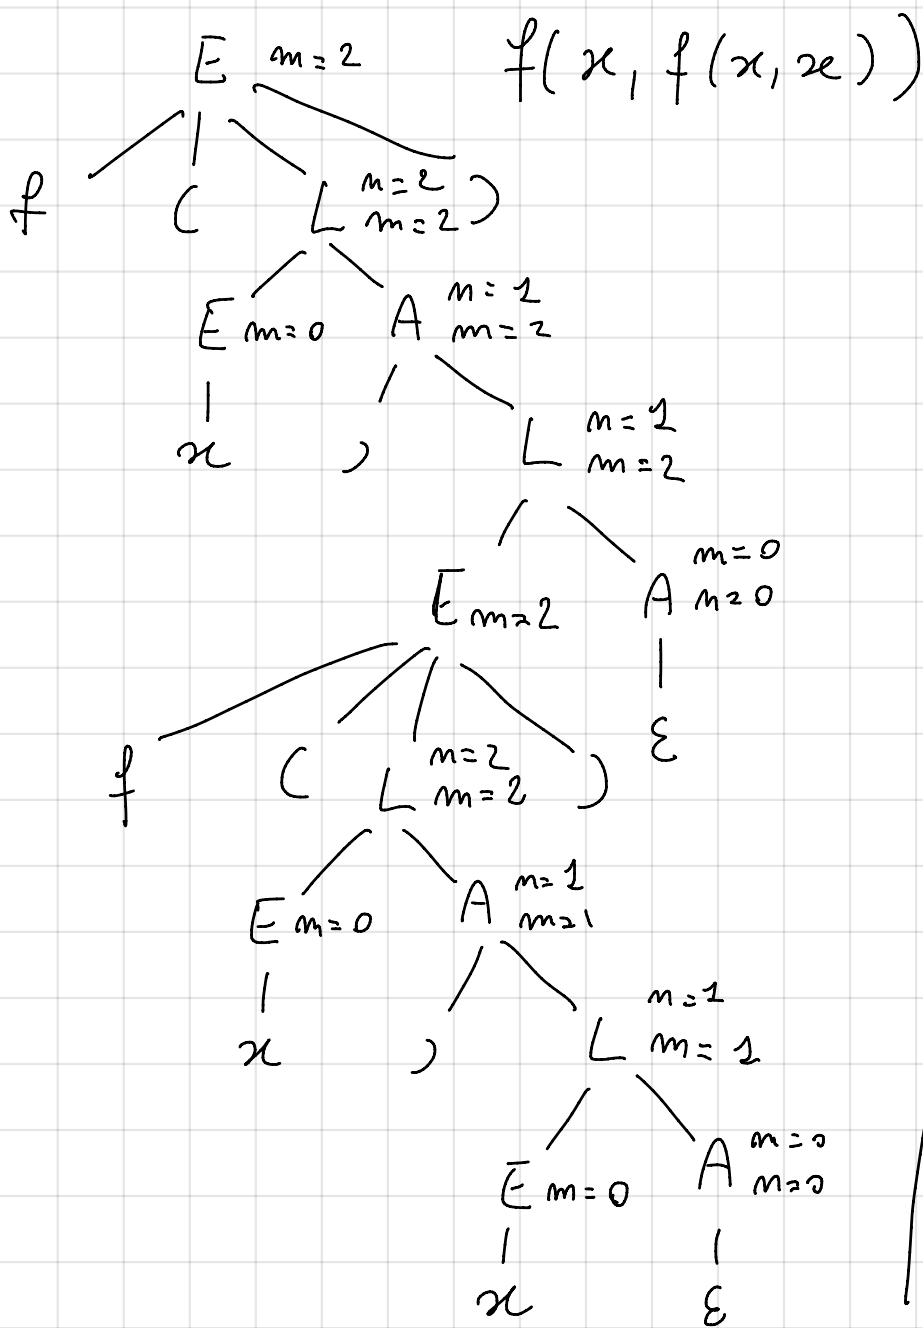

$$E \rightarrow x \quad \{E.m = 0\}$$

$$E \rightarrow f(L) \quad \{E.m = L.m\}$$

$$L \rightarrow EA \quad \{L.m = A.m + 1, L.m = \max(E.m, L.m)\}$$

$$A \rightarrow , L \quad \{A.m = L.m, A.m = L.m\}$$

$$A \rightarrow \epsilon \quad \{A.m = 0, A.m = 0\}$$

Attributes of symbols

m of type int
 synthesized
 for symbols E, L, A
 m is the maximum number
 of argument as requested

m of type int
 synthesized
 for symbols L, A
 m is the length of the current
 list

$f(f(x, x))$
