

# Welcome to

# Knowledge Engineering and Business Intelligence

Prof. Dr. Knut Hinkelmann  
Prof. Dr. Holger Wache

# Introduction to Knowledge-Based Systems

# Why is knowledge important for companies?

# What is the problem with knowledge?

## Discussion: What is knowledge work?

- Give examples of knowledge work
- Explain, why you regard this work as knowledge work.

## Some categories of knowledge work

### ■ Decision-Making

- ◆ Making a choice between different alternatives.

### ■ Diagnosis

- ◆ identification of the nature and cause of something, e.g. a disease or a failure in a machine; (can be a prerequisite for solving a problem)

### ■ Problem Solving

- ◆ Finding solutions to a problem satisfying specified goals, e.g. treatment of a disease

### ■ Design

- ◆ construction of an artifact (object or a system), satisfying a set of requirements, subject to constraints

### ■ Configuration

- ◆ special case of design activity, where the artifact is assembled from instances of a fixed set of component types

### ■ Planning

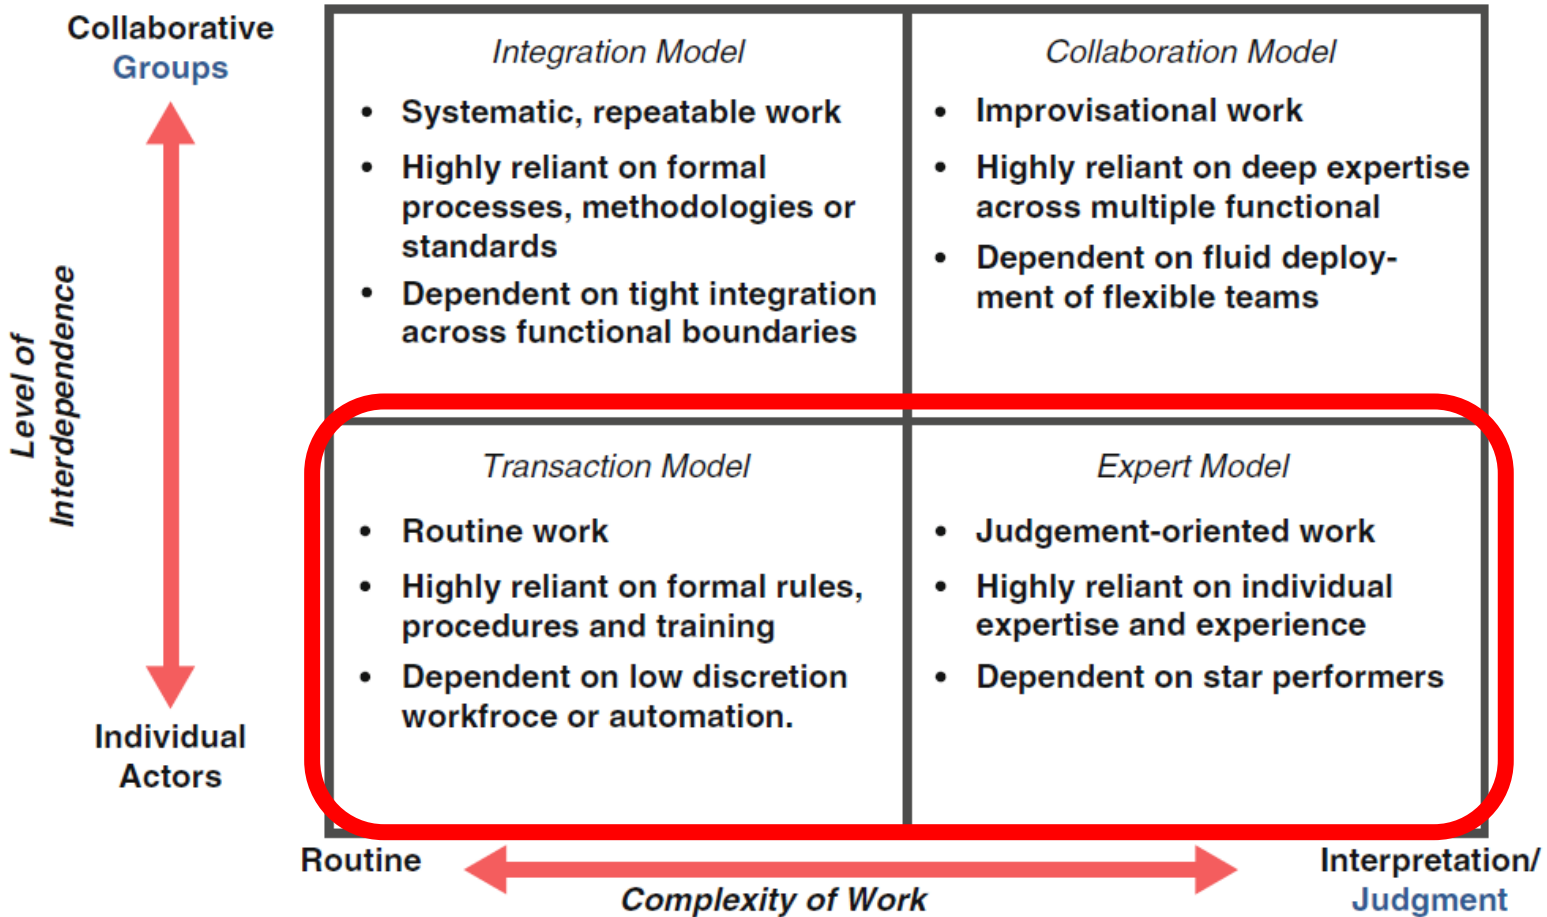

- ◆ organizing activities to achieve a desired goal

# Application of Knowledge

## Examples from a Car Rental Company

- Decision-Making
  - ◆ Choose between different offers for new cars
- Diagnosis/Problem Solving
  - ◆ Find the failure if the engine of the car does not start
- Configuration
  - ◆ Select equipment for new cars
- Planning
  - ◆ Scheduling of cars so that they are at the branch
- Information Retrieval
  - ◆ Find all documents with regulations about international drivers licences

# Types of Knowledge Work according to (Davenport 2010)

(Davenport 2010)

## Process-orientation for Knowledge Workers according to (Davenport 2010)

**Transaction workers.** Need to understand the flow of their work and the knowledge needed to perform it, but rarely have time to consult guidelines or knowledge sources. Process flow can be added into IT applications (workflows) bringing required information to the worker.

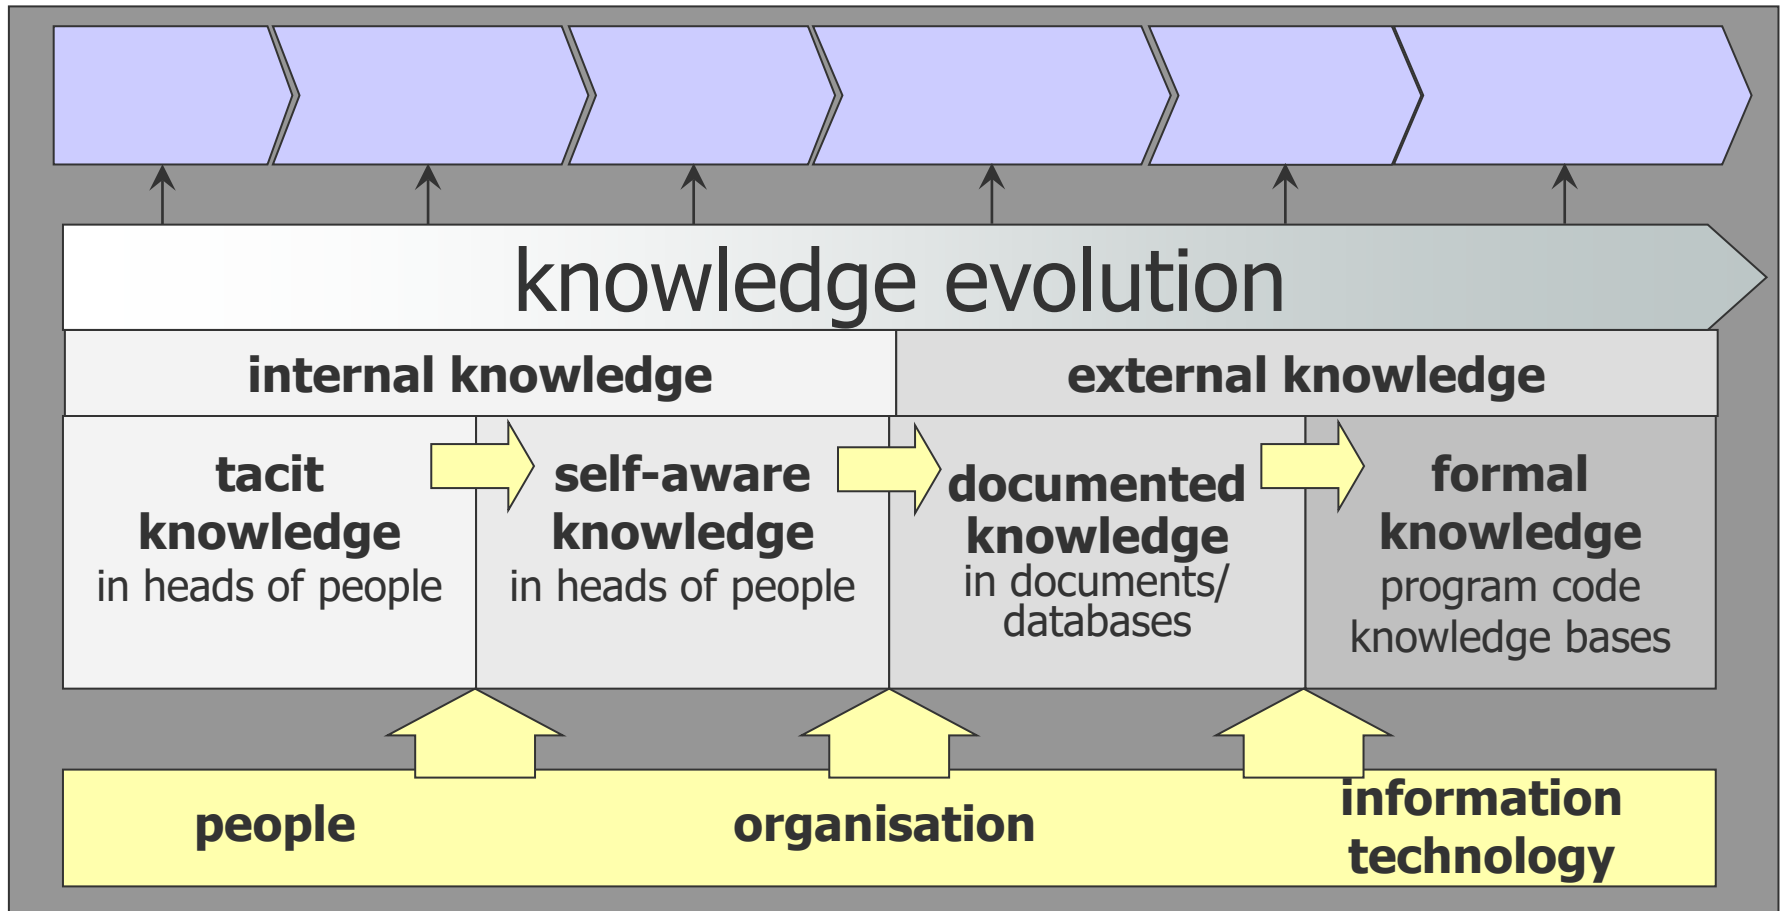

**Integration workers.** It is possible to articulate the process to be followed, e.g. by "standard operating procedures". Workers typically have enough time and discretion to consult the description.

**Expert workers.** High autonomy and discretion in the work. Expert knowledge work can be improved by providing templates, sample outputs, and high-level guidelines instead of specifying detailed process models.

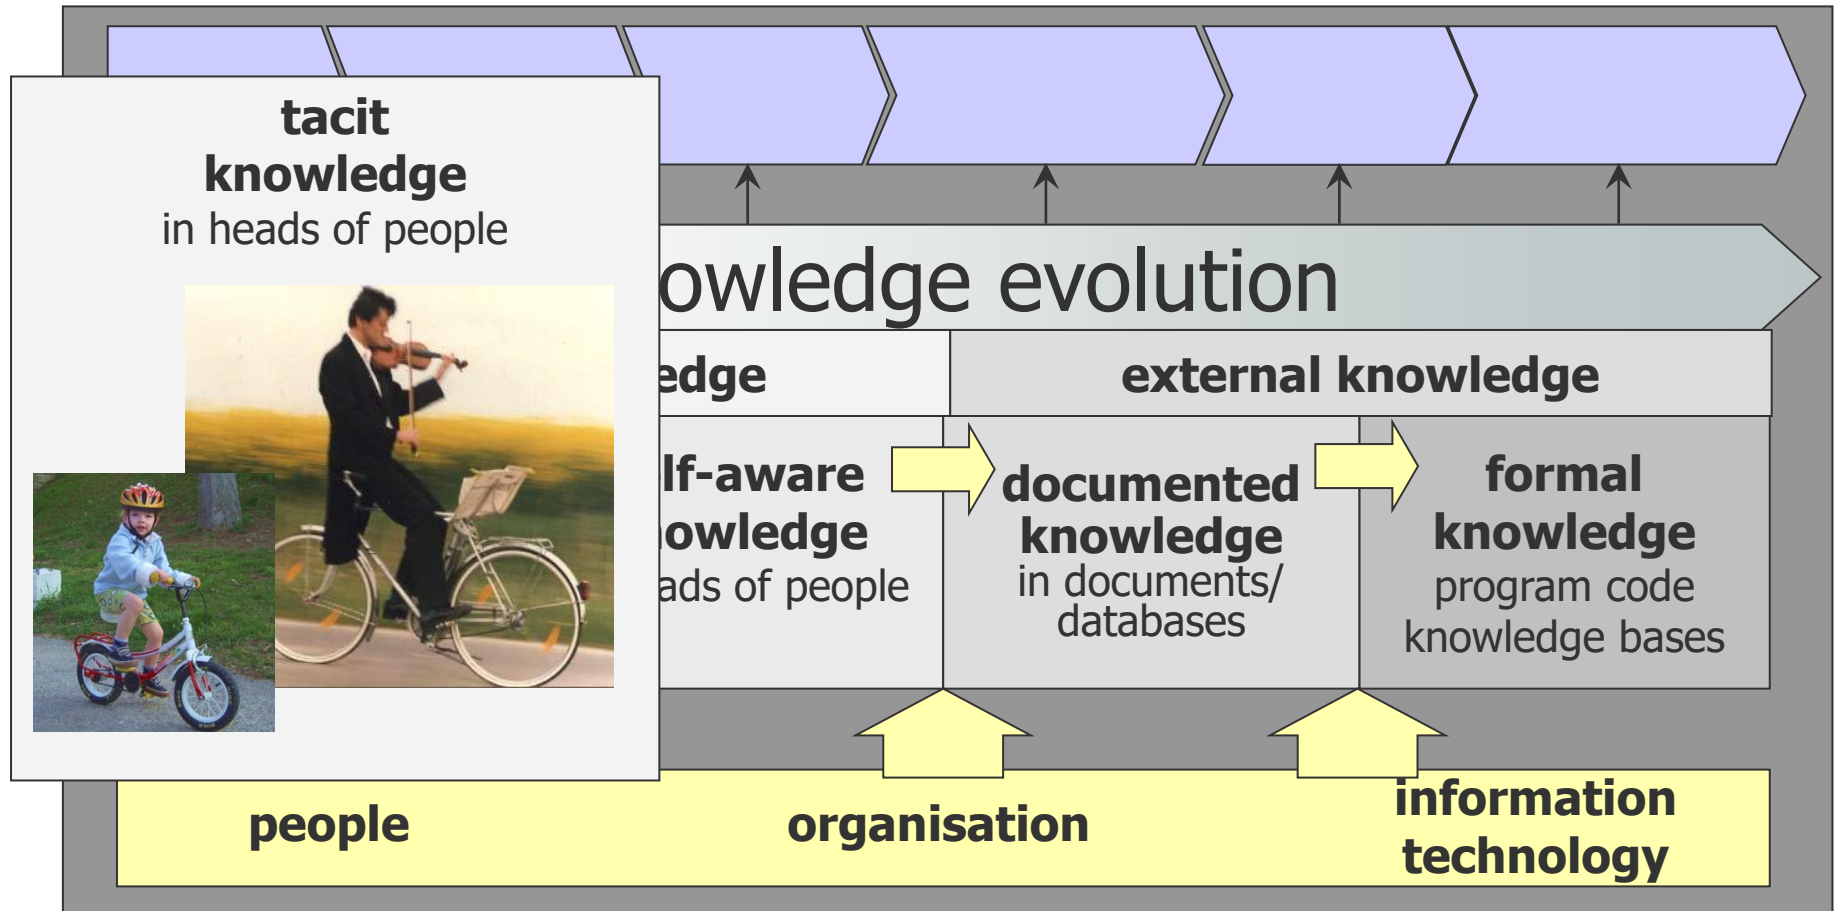

**Collaboration workers.** If external knowledge and information are necessary to do the job, they must generally be made available through repositories and documents

(Davenport 2010)

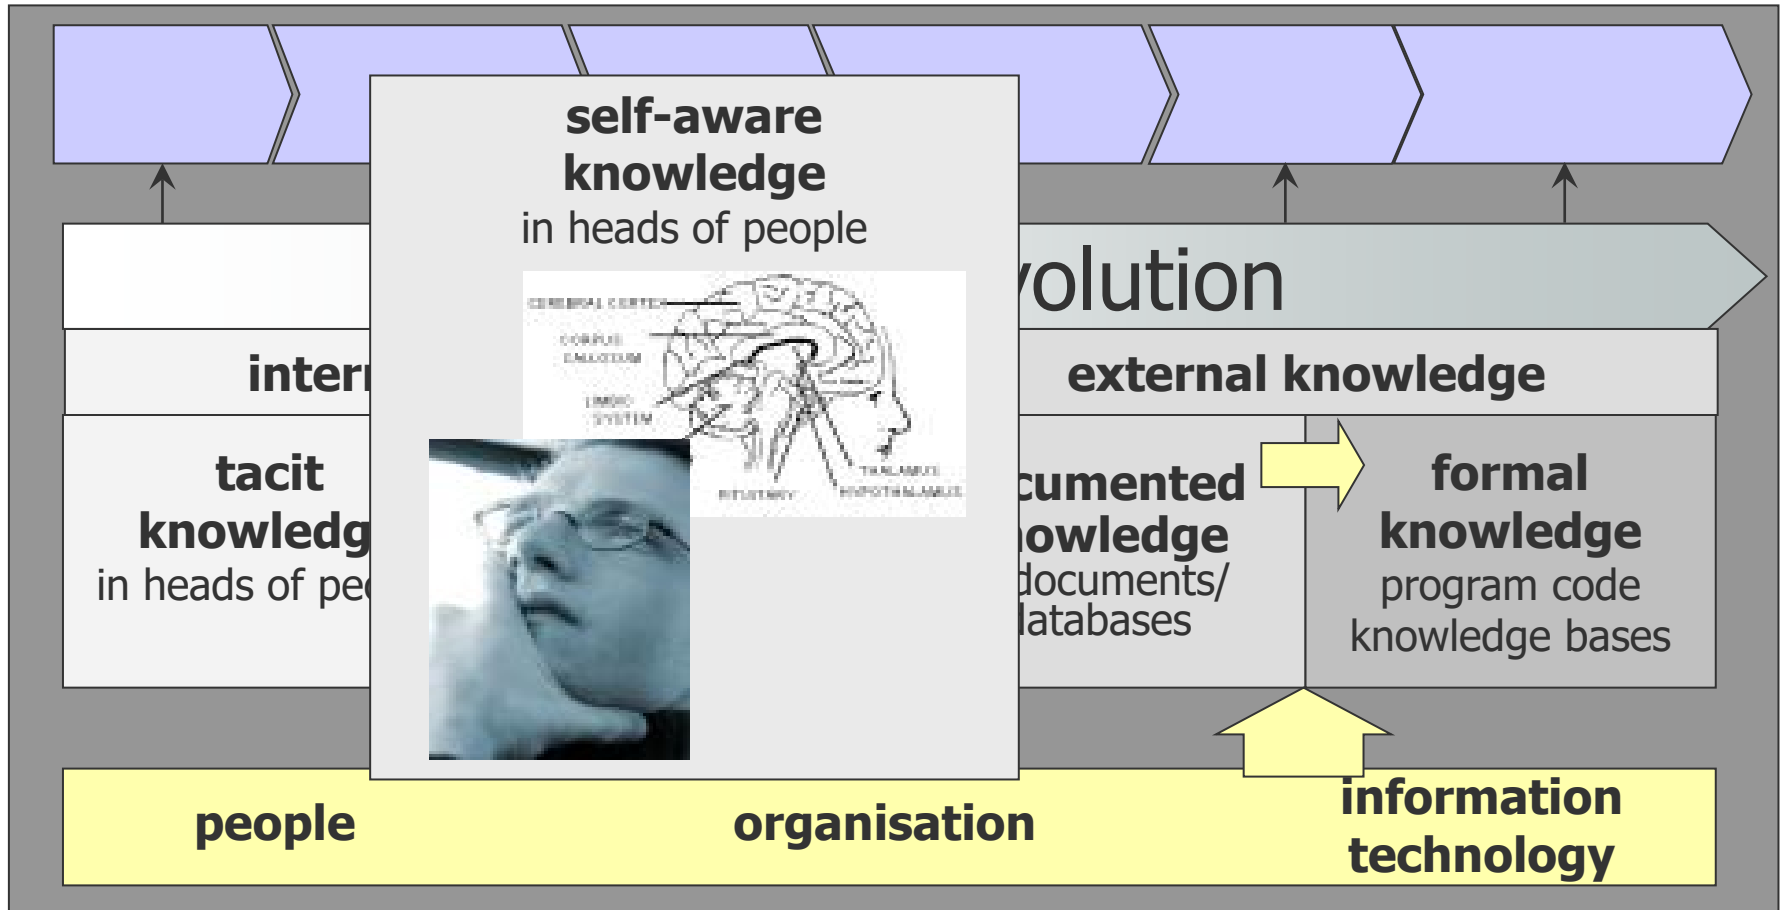

# Knowledge in Enterprises

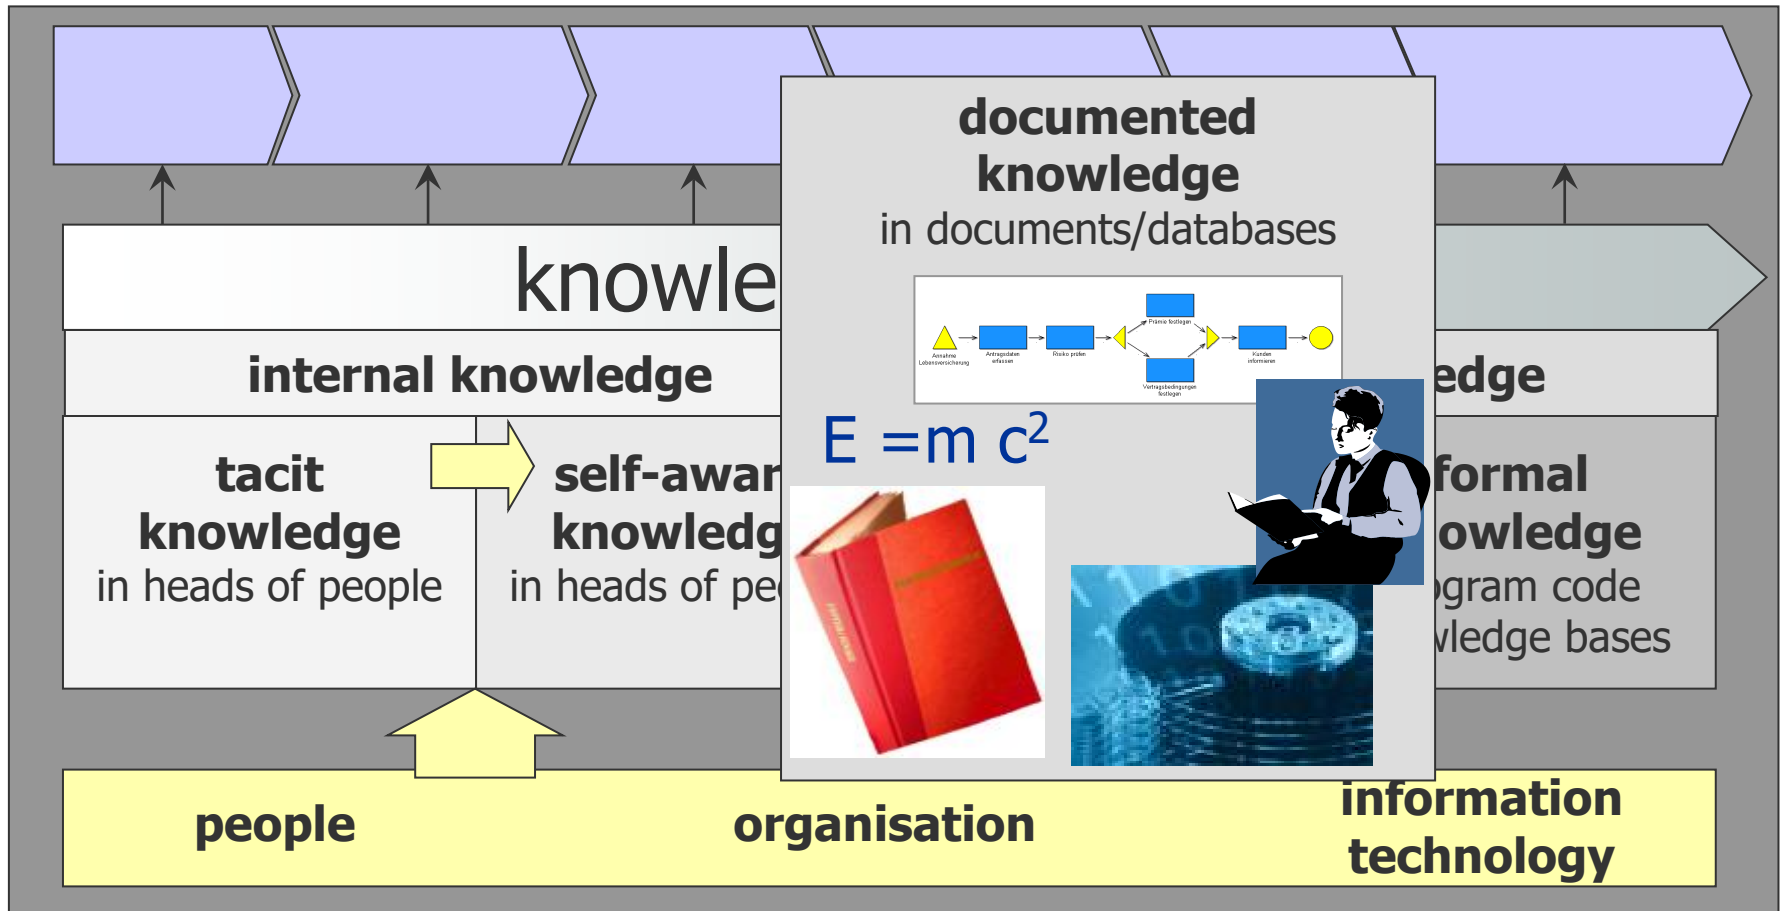

# Knowledge in Enterprises

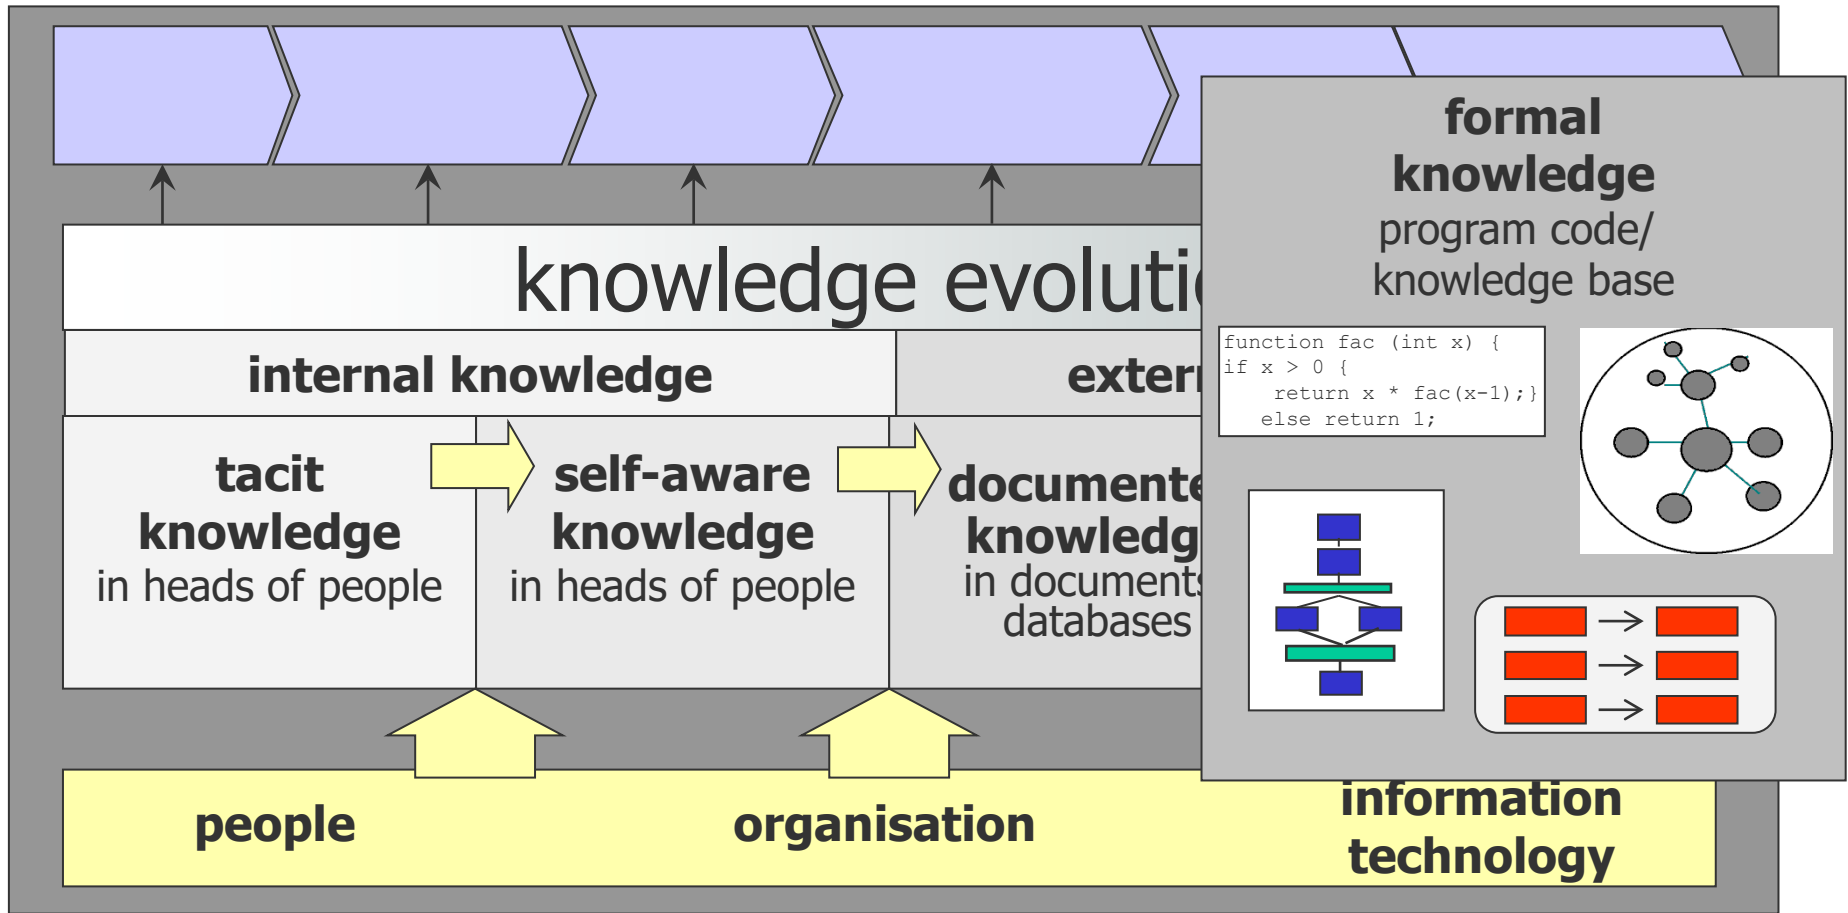

# Knowledge in Enterprises

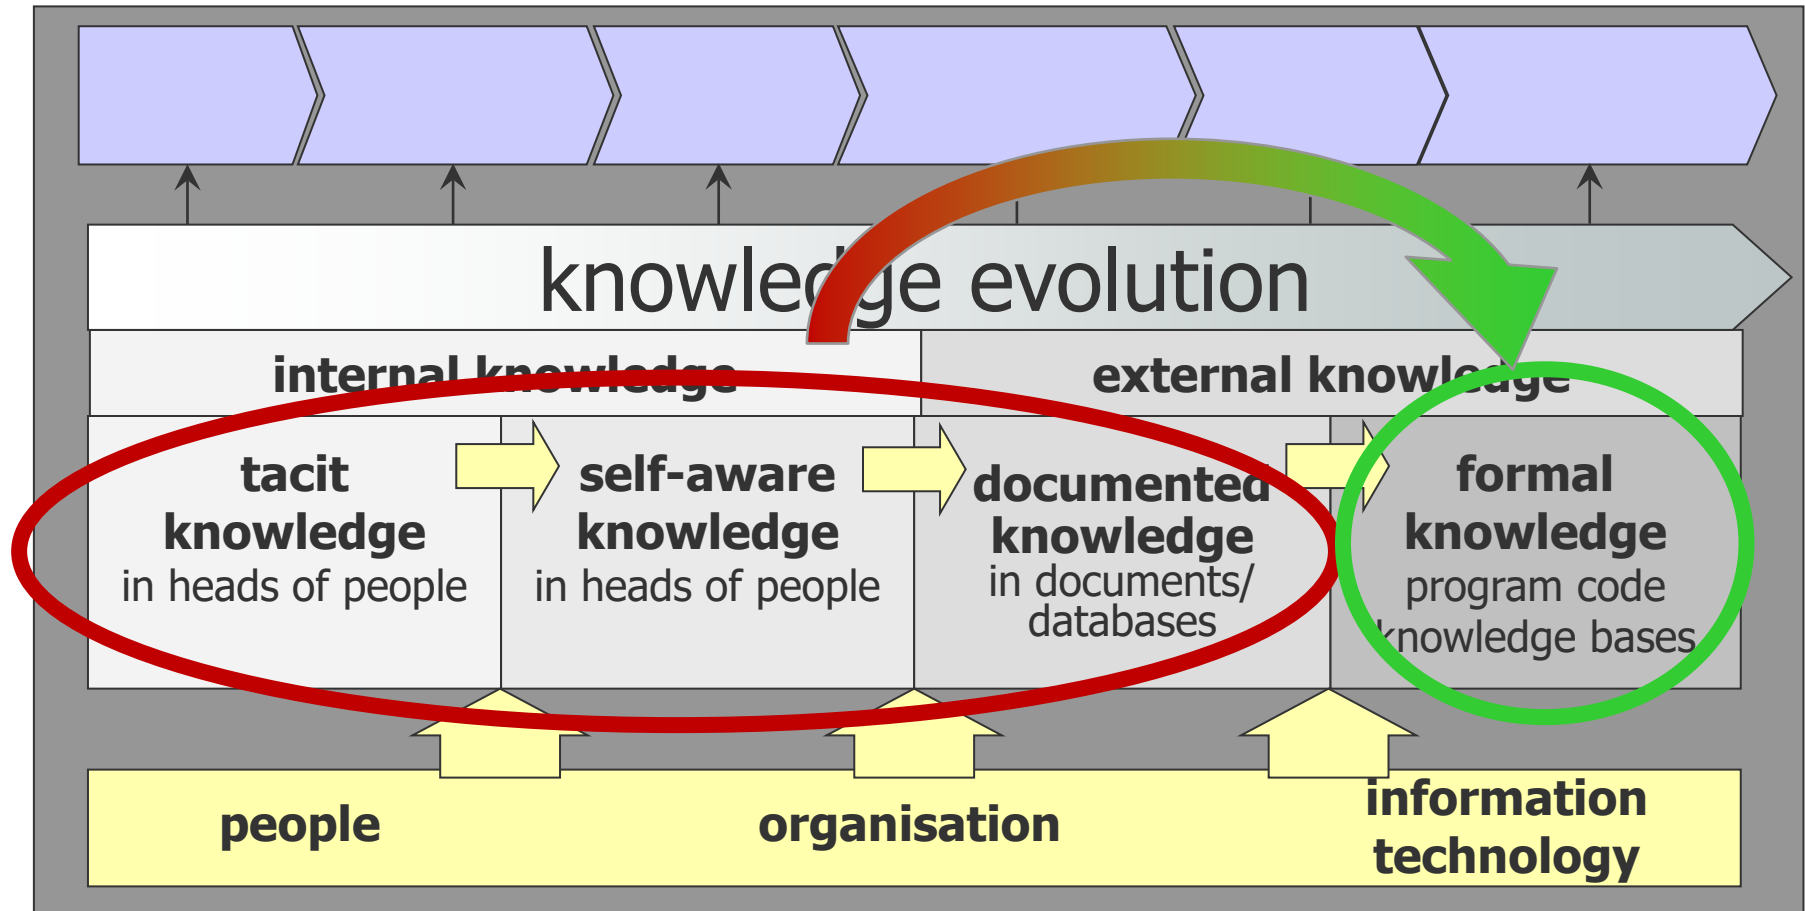

# Knowledge in Enterprises

# Knowledge in Enterprises

# Objective: Formalize Knowledge for Digitalization

## Problem Solving: Example

Placing a domino on a chess board

- Given a chess board where two opposite corners are missing
- A domino covers two adjacent field
- Is it possible to cover all fields of the board with dominos?

# Possible Solution Approaches

- Solution 1: Exhaustive Search  
Check all possibilities to put dominos on the board. Stop when all fields are covered or all possibilities failed.
- Solution 2: Heuristics  
Prune the search: Try only promising paths which seem to lead to a (good) solution.
- Solution 3: Knowledge

## Expert Systems

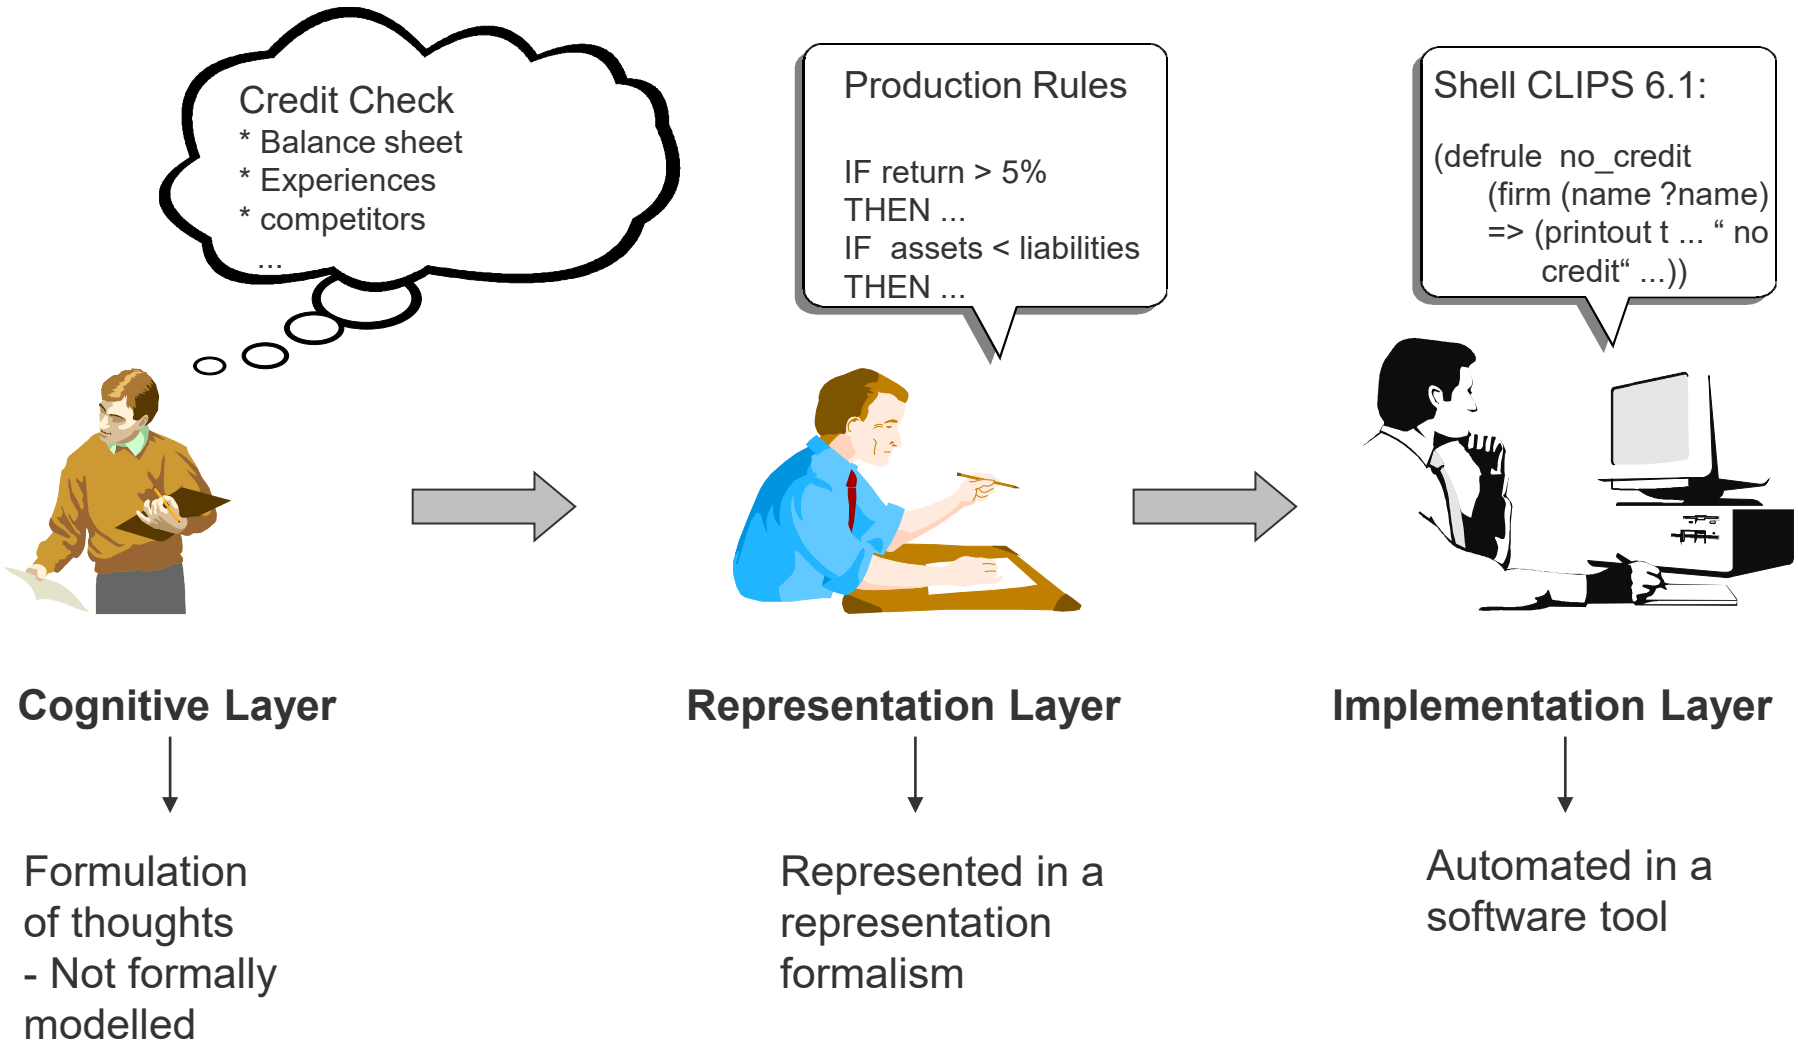

- *„An Expert System is an intelligent computer program that uses knowledge and inference procedures to solve problems that are difficult enough to require human expertise for their solutions.“ (Feigenbaum 1982)*
- The term „knowledge-based systems“ is often used synonym for „expert systems“. It makes clear that the system has an explicit knowledge base.

# Knowledge Layers

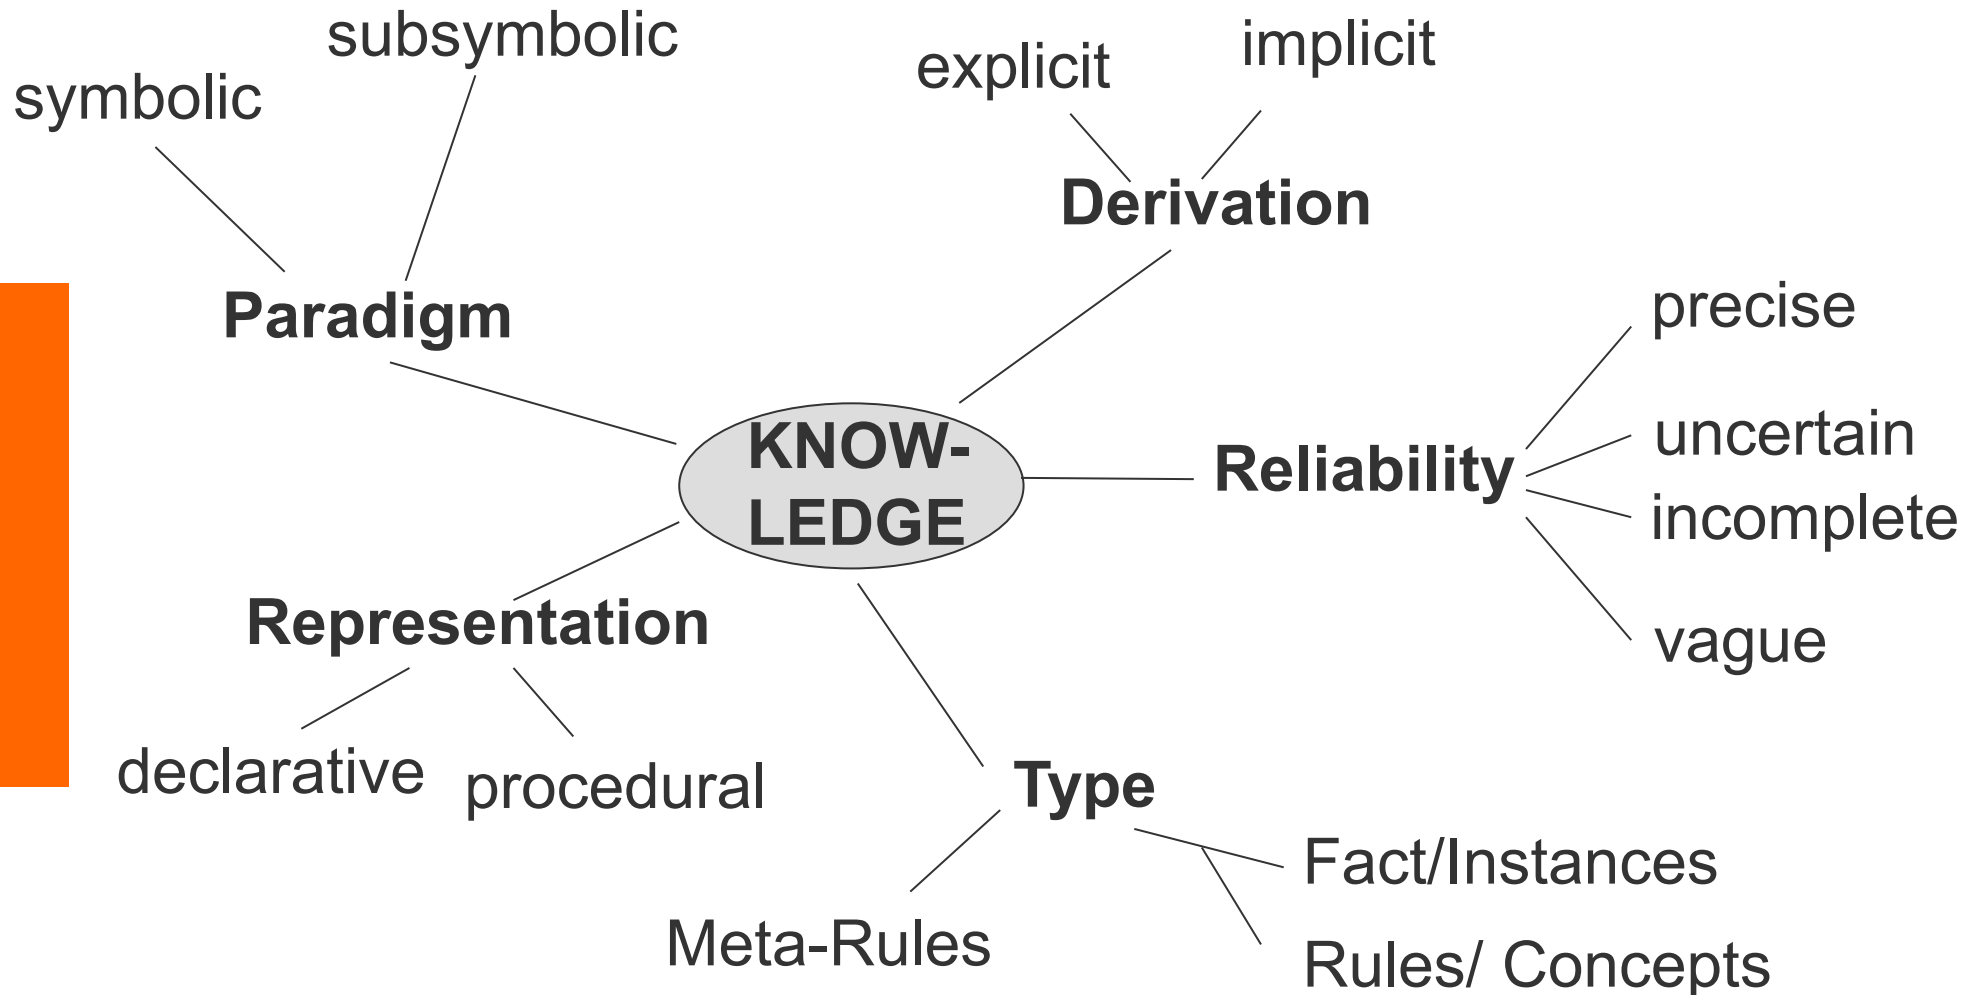

Knowledge can exist on different layers:

- Cognitive layer:  
Colloquial statement of thoughts; problems are getting modelled, but still not formalised.
- Representation layer:  
Formalisation of thoughts in a representation formalism (e.g. production rules, ontologies)
- Implementation layer:  
Formalisation has progressed so much, that the sequence is possible on a computer

# Layers of Knowledge-Based Systems

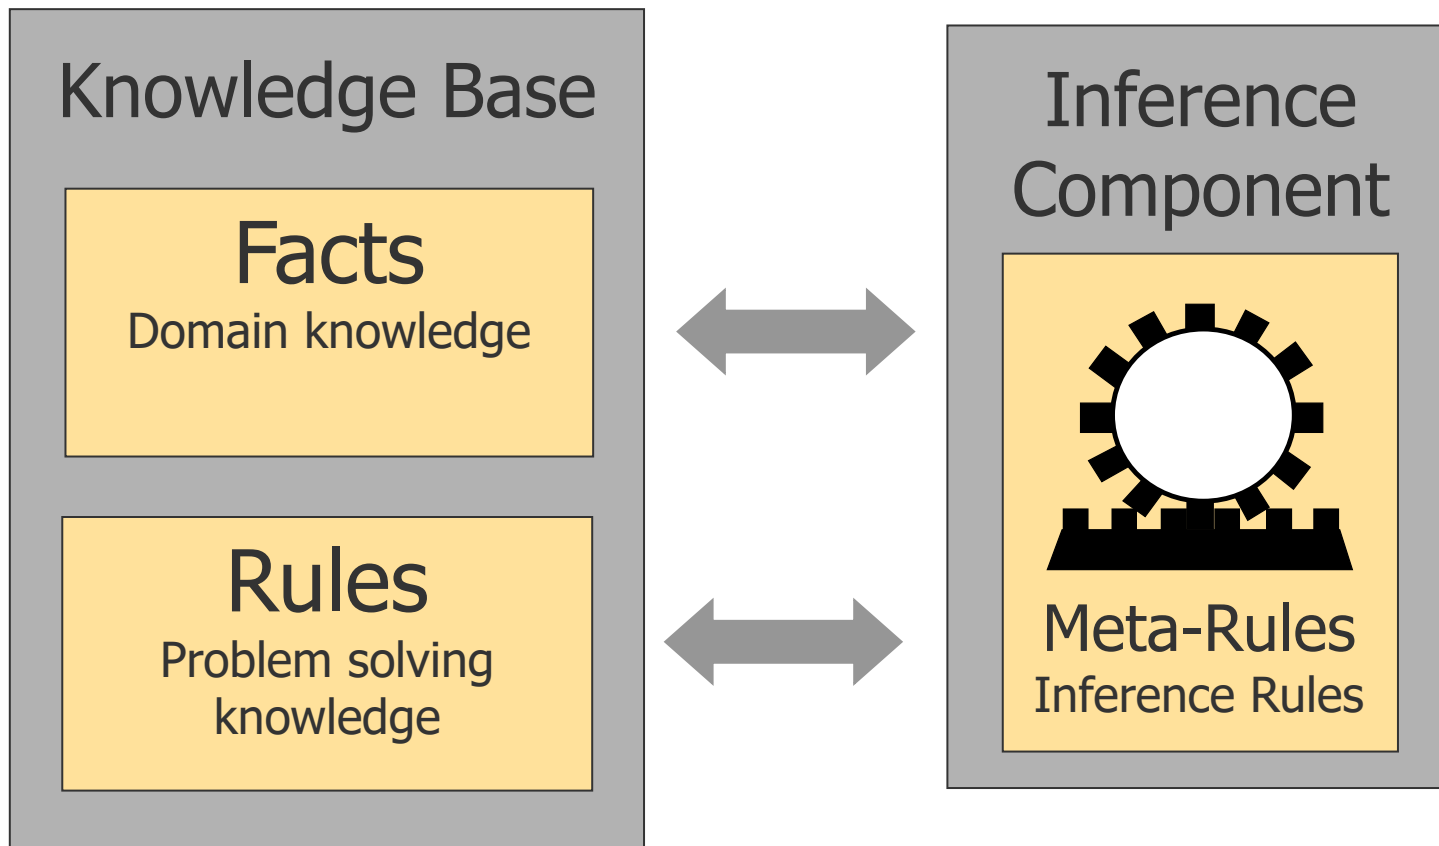

# Classification of Knowledge

# Reliability of Knowledge

- Precise knowledge:
  - ◆ „It is raining.“
- Uncertain knowledge:
  - ◆ „Probably it will not rain tomorrow.“
- Incomplete knowledge (knowledge not complete, but strongly delimited):
  - ◆ „The temperature ist between 10 and 15 degree Celsius“
- Vague knowledge (interpretation-dependent knowledge):
  - ◆ „The temperature is cold.“

# Knowledge-Based Systems (Rules & Facts)

# Types of Knowledge

- **Facts:** statements about reality
  - ◆ Example: *Socrates is human*
  
- **Rules:** General proposition about relations or procedure that are valid under specific conditions (e.g. in an „if ... then“-form“)
  - ◆ Example: *All humans are mortal*

## Derivation

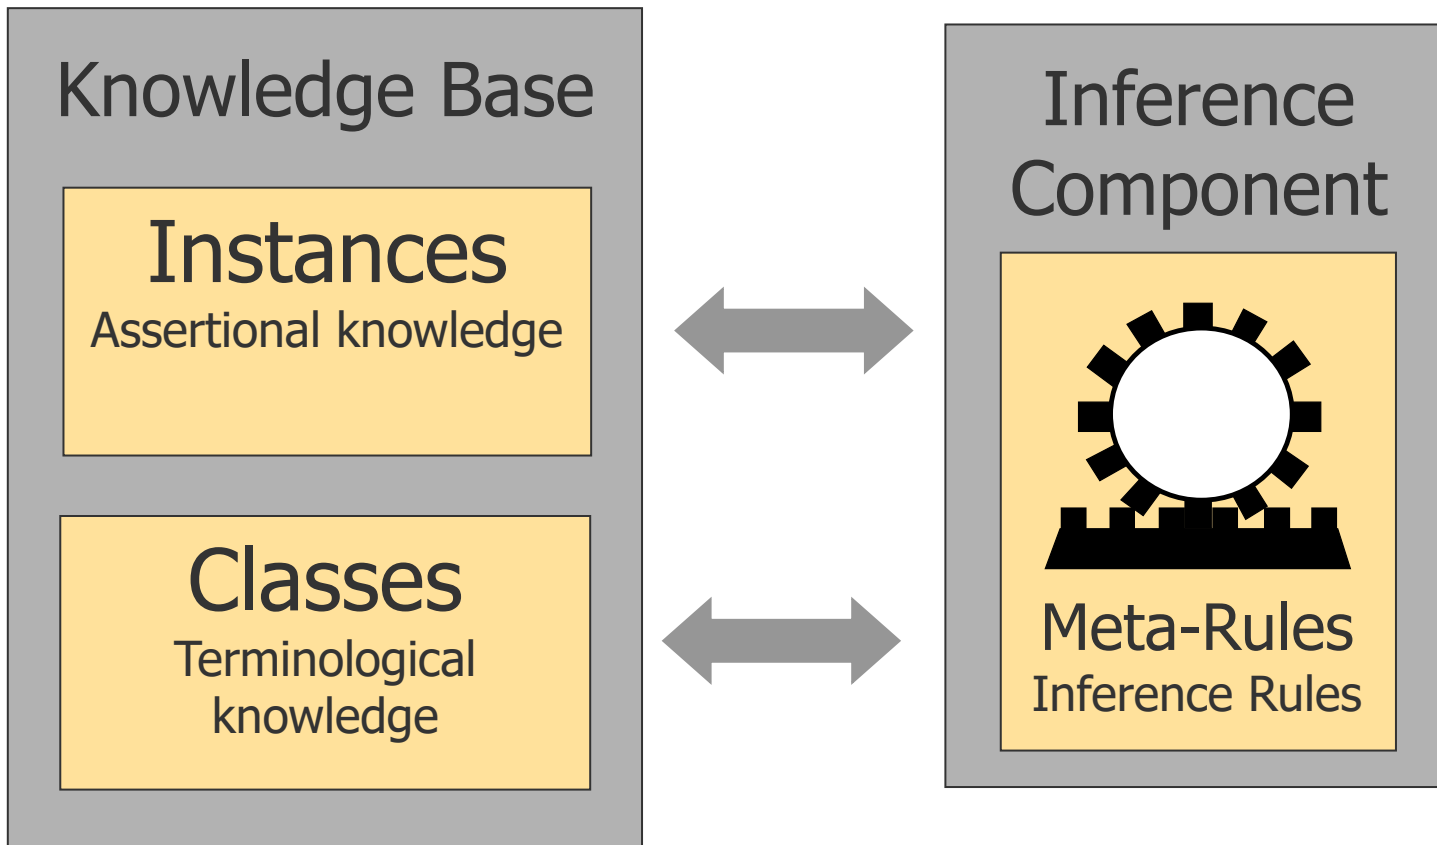

- Explicit knowledge:
  - ◆ knowledge which is stored in the knowledge base (static knowledge)
- Implicit knowledge:
  - ◆ not explicitly stated in the knowledge base
  - ◆ is determined from facts by application of rules
- *Derivation = Inference = Reasoning*
  - ◆ New knowledge is generated from existing one: Making implicit knowledge explicit

Socrates is human.  
All humans are mortal.

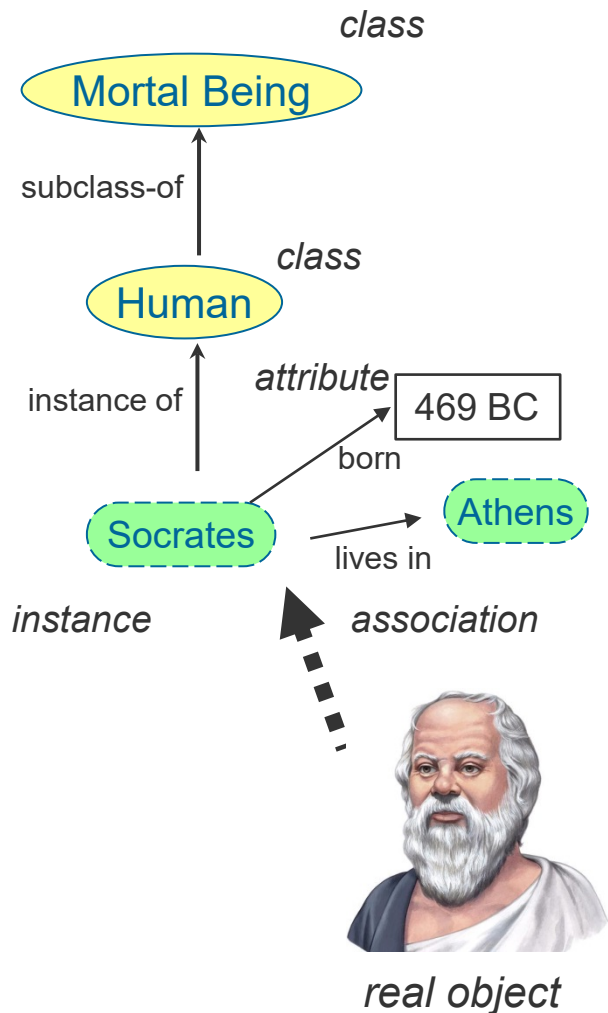

Socrates is mortal.

# Knowledge-Based Systems (Classes and Instances)

# Concepts, Instances and Relations

- There are two kinds of concepts:
  - ◆ **classes**
  - ◆ **instances**
- There are different kinds of relations
  - ◆ **generalisation** ("is a")
    - between classes (**subclass of**)
    - between instance and class (**instance of**)
  - ◆ **aggregation and composition**
    - "part-of" relationship
  - ◆ **associations**
    - any other kind of relationship
- Attributes can be regarded as associations whose value is not an instance but is of a primitive type (number, string).

## Types of Knowledge

- Instances: statements about real objects
  - ◆ Example: Socrates
- Classes: Groups with common characteristics
  - ◆ Example: human, mortal being

### Relations:

- Instance of:
  - ◆ Socrates is human  
"Socrates is an *element* of the set of all humans"
- Subclass of ("is a"):
  - ◆ Humans are specializations (is-a) of Mortal Beings  
"Humans are a *subset* of the set of all mortal beings"

# Derivation

## ■ Explicit knowledge:

- ◆ knowledge which is filled away in the knowledge base (static knowledge)

## ■ Implicit knowledge:

- ◆ not explicitly stated in the knowledge base
- ◆ is determined from facts by application of rules

## ■ *Derivation = Inference = Reasoning*

- ◆ New knowledge is generated from existing one: Making implicit knowledge explicit

Socrates is a Human.  
Humans are specializations  
(is-a) of Mortal Beings.

deductive  
inference →

Socrates is a  
Mortal being.

# Meta Rules

- Meta Rules ...
    - ◆ implement the Inference
    - ◆ control the application of rules/concepts
    - ◆ are part of the Inference Engine
  - Meta Rules can be general, e.g.
    - ◆ If all conditions of a rule are satisfied then add the conclusion to the knowledge base
    - ◆ If more than one rule can be applied use the most specific one
    - ◆ First check whether the
- ... or domain specific
- ◆ For underwriting in health insurance, first apply the rules that deal with the health conditions and then check for the credibility of the applicant

## Example of a Declarative Knowledge Base

father(peter,mary)

father(peter,john)

mother(mary,mark)

mother(jane,mary)

---

father(X,Y) AND father(Y,Z)  $\rightarrow$  grandfather(X,Z)

father(X,Y) AND mother(Y,Z)  $\rightarrow$  grandfather(X,Z)

mother(X,Y) AND father(Y,Z)  $\rightarrow$  grandmother(X,Z)

mother(X,Y) AND mother(Y,Z)  $\rightarrow$  grandmother(X,Z)

father(X,Y) AND father(X,Z)  $\rightarrow$  sibling(Y,Z)

mother(X,Y) AND mother(X,Z)  $\rightarrow$  sibling(Y,Z)

The rules can be used to

- Derive all grandparent and sibling relationships (forward chaining)
- Answer questions about relationships (backward chaining)

## Example of a Declarative Knowledge Base

father(peter,mary)

father(peter,john)

mother(mary,mark)

mother(jane,mary)

---

father(X,Y)  $\rightarrow$  parent(X,Y)

mother(X,Y)  $\rightarrow$  parent(X,Y)

father(X,Y) AND parent(Y,Z)  $\rightarrow$  grandfather(X,Z)

mother(X,Y) AND parent(Y,Z)  $\rightarrow$  grandmother(X,Z)

parent(X,Y) AND parent(Y,Z)  $\rightarrow$  grandparent(X,Z)

parent(X,Y) AND parent(X,Z)  $\rightarrow$  sibling(Y,Z)

## Declarative vs. Procedural Knowledge

- *Declarative knowledge*: The representation of knowledge is independent of an inference engine
- *Procedural knowledge*: The representation of knowledge determines its use, e.g. representing actions, order/flow of tasks, updating knowledge
  - if* a car reaches the traffic light
  - and* the traffic light has switched to red
  - then* hold at the stop line
  
  - if* account balance is X
  - and* deposit is Y
  - then* account balance is  $X + Y$

# Paradigms of Knowledge Processing

## ■ Symbolic Systems:

- ◆ Logic Systems:
  - Representations: logical formulas
  - Derivation of knowledge: Inference (Deduction)
- ◆ Non-Logic Systems:
  - Representations: condition-action rules
  - Derivation of knowledge: Inference
- ◆ Fuzzy Systems:
  - Representation: linguistic formulated knowledge
  - Derivation of knowledge: Approximate conclusion

## ■ Subsymbolic Systems:

- ◆ Neural Networks
  - Representation: units, weights between units
  - Derivation of knowledge: Connotation

# Are Machines Able to Think? – The Turing-Test

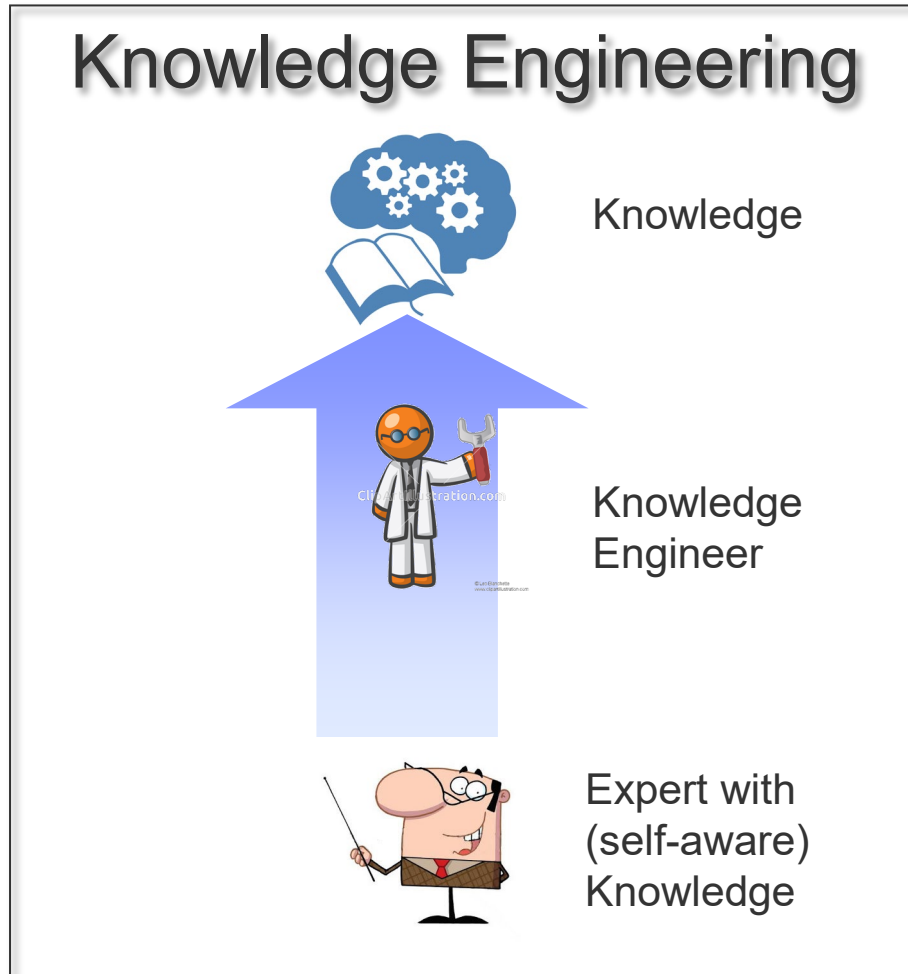

- Are Machines able to think?
- In order to find an answer to this question, the English computer pioneer A. Turing developed 1950 the so-called Turing-Test
- Test arrangement:
  - ◆ Room A: interviewer
  - ◆ Room B: Computer and Human
- The interviewer asks questions from different fields aiming to discover whether the computer or the human has provided the answer.
- The computer has passed the Turing-Test, if the interviewer cannot say who answers the questions, the computer or the human.

# How can you acquire the knowledge?

# Acquiring Knowledge

# Knowledge Engineering

# Knowledge Engineering

- Knowledge Engineering is the process of
  - ◆ building and
  - ◆ maintainingknowledge-based systems or intelligent agents
- *“Knowledge Engineering is an engineering discipline that involves integrating knowledge into computer systems in order to solve complex problems normally requiring a high level of human expertise.”<sup>1)</sup>*
- Sources of knowledge
  - ◆ Human experts
  - ◆ Documentation

1) Feigenbaum, E., and P. McCorduck. (1983). The Fifth Generation. Reading, MA: Addison-Wesley

# Face Recognition

# Self-driving Cars

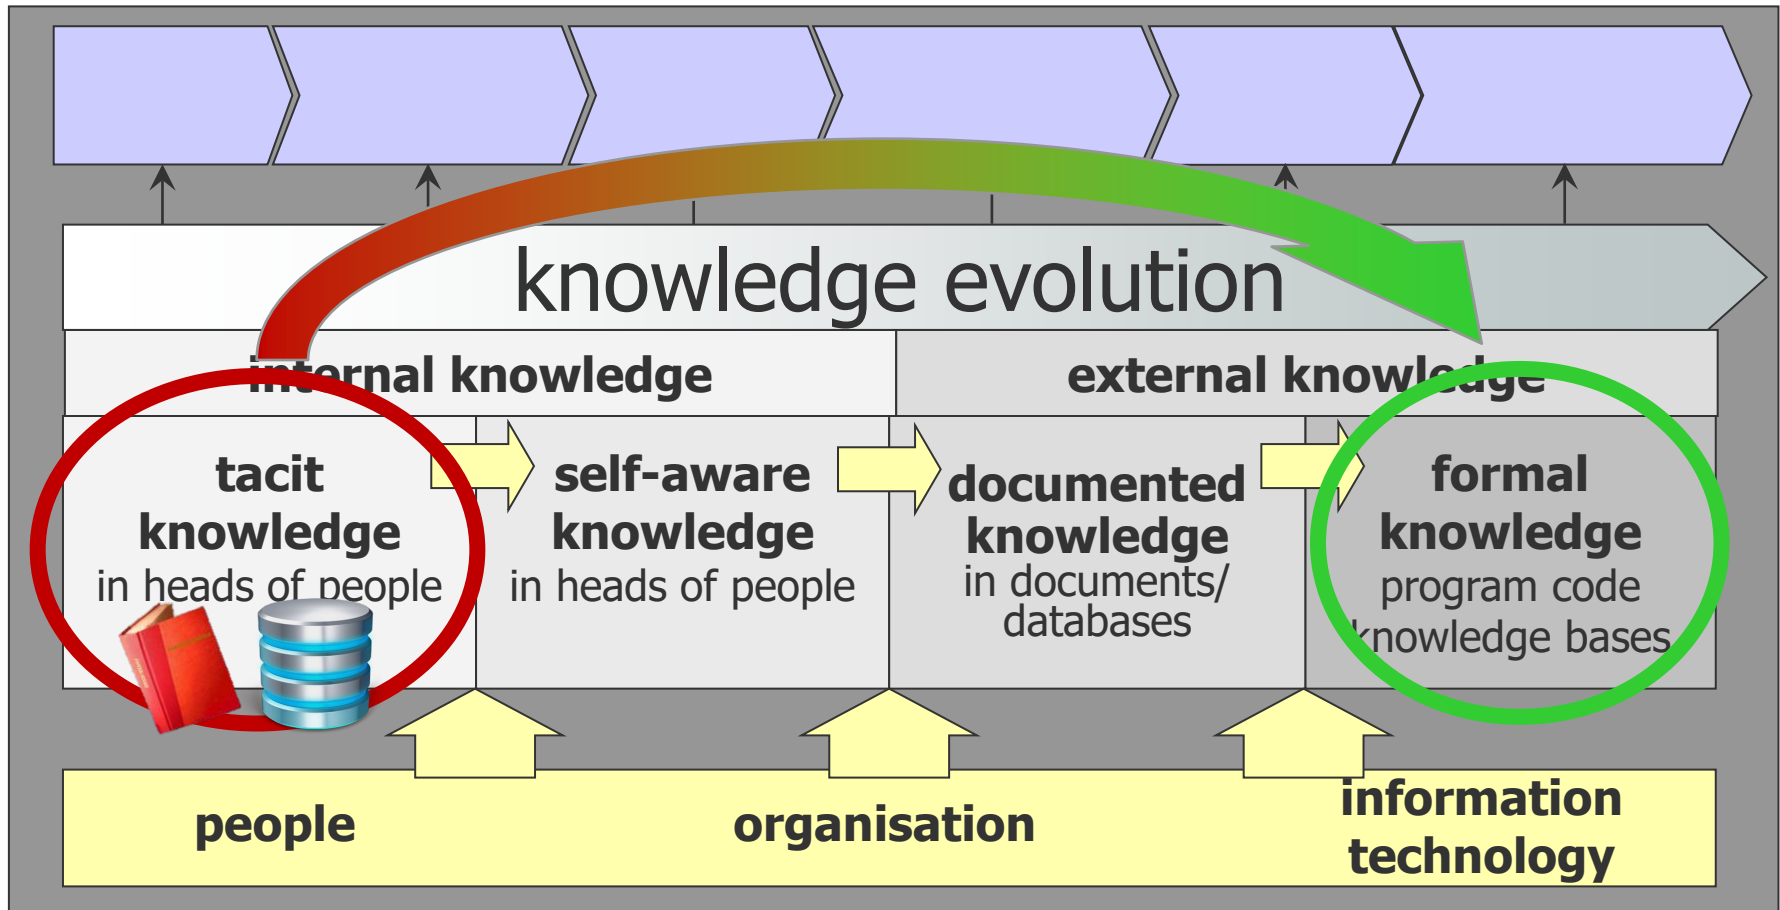

*“... it is hard to imagine discovering the set of rules that can replicate the driver’s behavior.”*

(Levy & Murnane 2006)

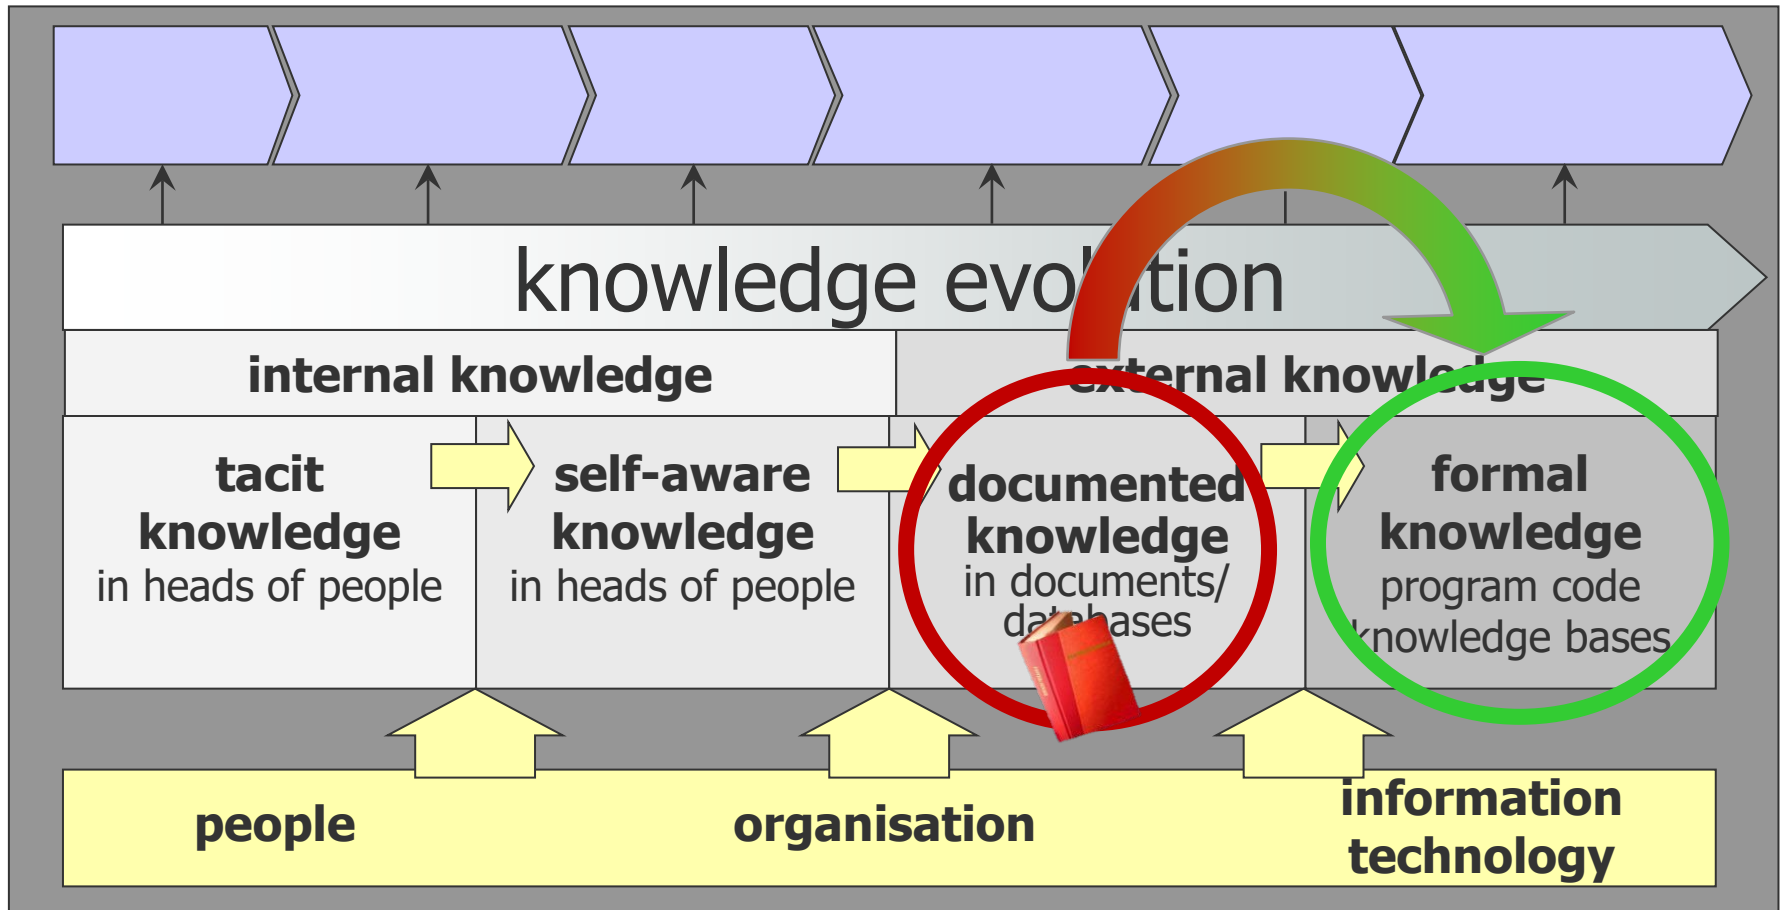

# Machine Learning: Make Knowledge explicit with the Use of Data

From data (texts or structured data) it is possible to learn tacit knowledge and new knowledge

# Machine Learning: Learning from Documents

# Why Machine Learning now?

- Recent progress in algorithms and theory
- Growing flood of (online) data
- Computational power is available

# Applications for Machine Learning:

- Data mining: using historical data to improve decisions
  - ◆ medical records → medical knowledge
  - ◆ customer segmentation: find groups of customers with similar interests
  
- Software applications we can't program by hand
  - ◆ autonomous driving
  - ◆ speech recognition: Alexa, Siri, ...
  - ◆ image recognition: recognizing unknown people on photos
  
- Self customizing programs
  - ◆ newsreader that learns user interests

# Combining Knowledge and Machine Learning: Self-driving Cars

- Machine Learning:  
Driving Behaviour
- Knowledge Engineering:  
Traffic Rules

# Combining Machine Learning and Knowledge Engineering: Health Insurance (1/3)

# Combining Machine Learning and Knowledge Engineering (2/3)

- Example: Application of health insurance
  - ◆ Machine Learning: data records about risks of clients

Age	surgery	docvisit	allergy	med	diseases	bmi	class
20	0	2	no	no	cholesterol	28	low
21	0	4	no	no	no	23	low
49	2	12	yes	yes	heart	34	high
22	0	3	no	no	no	23	low
51	2	2	yes	yes	diabetes	26	high
52	2	8	no	no	heart	31	high
52	0	3	yes	no	no	22	low
52	2	12	yes	yes	diabetes	27	high
52	0	11	yes	no	cholesterol	29	high
23	0	3	no	no	no	23	low

- ◆ Engineered knowledge: eligibility and compliance

Applicants from Switzerland are eligible.  
A person younger than 21 year is not able to apply

...

# Combining Machine Learning and Knowledge Engineering (3/3)

## Examples of learned rules:

risk (Person, high) :- age(Person,A), A > 50,  
bmi(Person, Bmi), Bmi =<25,  
disease(Person, diabetes).  
risk (Person, low) :- age(Person,A), A =< 29.

## Examples of engineered rules:

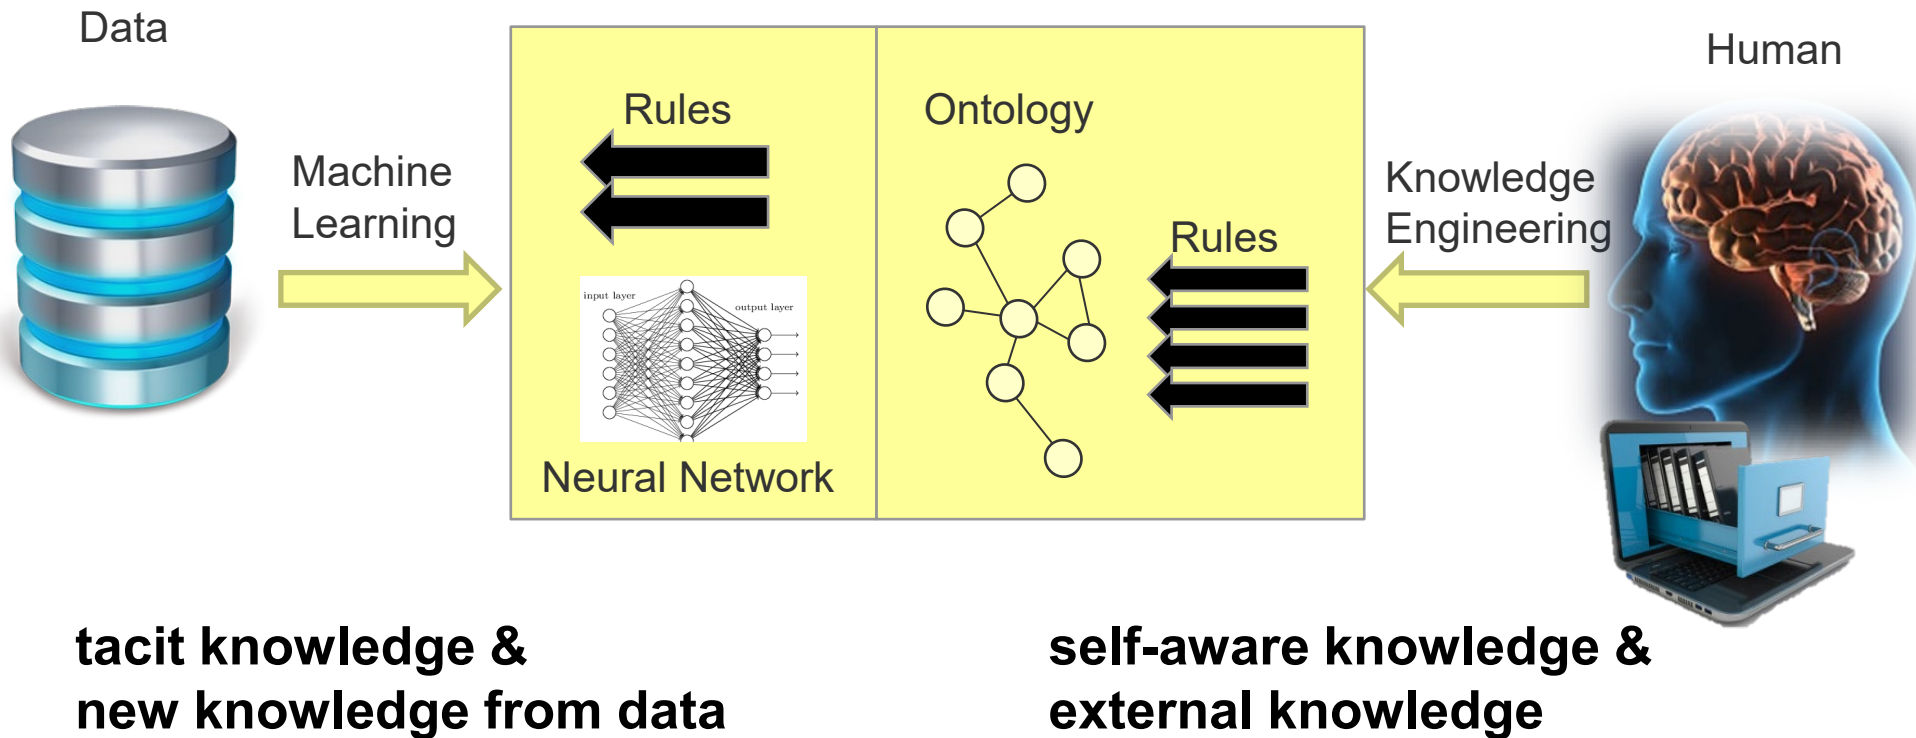

eligible(Person, no) :- age(Person,A), A =< 21.  
eligible(Person,no) :- country(Person,C), C != switzerland.

## Combining engineered and learned rules:

accept(Person, yes) :- eligible(Person, yes), risk(Person, low).  
accept(Person, yes) :- eligible(Person, yes), risk(Person, medium).  
accept(Person, no) :- eligible(Person, no).  
accept(Person, no) :- risk(Person, high)

# Summary: Knowledge Sources in a Knowledge Base

**tacit knowledge &  
new knowledge from data**

**self-aware knowledge &  
external knowledge**
